SUBSCRIBE FOR IT.—The large, illustrated sixty-four column weekly newspaper—the San Francisco Mining and Scientific Press—should be taken by every miner, prospector, and intelligent citizen throughout Colorado, as it gives a mint of most useful information to be gained no other way, on mining matters generally.—[Rocky Mountain News.

Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

HOADLEY'S.

FOUR SIZES,

8, 10, 12, and 15-Horse Power,

HOADLEY'S.

3 to 40-Horse Power.

HITTINGER'S.

THREE SIZES,

5, 7, and 10-Horse Power!

HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes. Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises.) In fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages.
Also, Portable Saw and Grist Mills.
For sale by
TREADWELL & CO.,
15v12 Corner of Front Market and streets.

NEW PATENTS AND INVENTIONS.

Under this heading we shall mention, from week to week, as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

PROCESS FOR REFINING OIL.—E. G. Sotherland, of San Francisco, claims, substantially, the following process for extracting and refining oil from whales and other marine animals and fishes: The hlobber is taken from the fish or animal and placed in a steam-tight tank, having a grating near its bottom, and into which steam is admitted from a steam boiler, and by which the oil is more rapidly and more completely extracted than by the ordinary process of "trying out" by the direct action of fire. The pressure of the steam, at the same time, forces the oil and all other fluid matter from the tank, as above described, through a tube placed near its lower extremity, into another tank conveniently placed at a lower level. This latter tank is partially filled with cold water. The effect of this last process is, that while the oil remains floating on the top of the water, the blood and other foreign matter goes to the bottom or mingles with the water, after which the oil may be drawn off by a stop-cock at leisure into another tank or beater, having a false bottom, with a steam or fire chamber, by means of which any water remaining in the oil may be removed by means of evaporation. Another receptacle or tank of iron or other material is placed near the tank or heater last described, in which is placed a coil of pipe or worm. Water is introduced into this tank for the purpose of keeping the worm cool, which can be removed as fast as it becomes heated. The oil is now drawn off from the "heater" to this coil, and conveyed to casks or pipes.

It is evident that by this process the oil is obtained much purer, of a better color, and entirely free from all danger of being "burned," and also that a large increased percentage of oil can be obtained from the same amount of blubber.

NEW INVENTIONS.

AN IMPROVED COFFEE POT AND TEA POT.—E. D. McCarthy, of this city, who recently obtained, through the MINING AND SCIENTIFIC PRESS AGENCY, a patent for a "Noiseless India Rubber Tappet," for quartz mills, has recently perfected another invention, for which he will apply for a patent. His second invention consists of a very neat and convenient arrangement which may be used for either a coffee or teapot. The peculiarity of its construction is that in the centre of the vessel is a cylinder made of tin, perforated like card-board for embroidery, and fastened to the bottom so as to be stationary. This cylinder reaches nearly to the top of the teapot, and is open at the upper end. A second cylinder, made in the same manner, but detached, is made to shut up with a lid, like a candy jar, and slip neatly inside the fixed one. Into this second cylinder the coffee or tea is placed dry, and the cylinder is then slipped into the larger one and the water poured in. The coffee or tea of course pours off clear at once, and as the water entirely surrounds the inner cylinder, none of the aroma is lost. To clean it the cook has merely to take the inner cylinder out, take off the lid, shake it bottom upwards, and the work is done. Application for a patent for this invention has been made through the MINING AND SCIENTIFIC PRESS PATENT AGENCY.

PATENT RAILROAD BUILDER.—William D. Robertson, of Humboldt, has invented a machine for expediting and cheapening the construction of railroads, which consists of a platform car, fifty or sixty feet long, to be propelled by animal power or a donkey engine, which is supplied with machinery to perform the following work; level the grade for the ties, drop the ties in their proper places, bed the ties by means of stamps, smooth the top of the ties by means of a revolving cutter, lay the rails from iron chairs as soon as the ties are ready, drop the spikes through grooves to their proper places, and drive the spikes by hammers regulated with a cam. It is intended to lay about five miles of track in six hours, with the labor of twelve men. Mr. Moore, of the Vulcan Iron Works in San Francisco, and several others of our best mechanics, are engaged in giving a thorough, critical examination to the plan. If found practicable, it must prove of great utility in economizing time, labor and expense.

PATENTS can be obtained for citizens on this Coast through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. In one-half the time it takes to operate through Eastern Agents, and from our familiarity with the subject of most California inventions, and the prompt and careful explanations, we are prepared to present claims with greater accuracy than could reasonably be expected of distant Agents. BURNETT'S STEAM CRANE.

The accompanying engraving represents a very convenient and useful "portable crane," designed for light work. It may be mounted on a railroad or other car for transport from place to place, or for following up its work when necessary. It is made of various sizes, calculated to lift from five to twenty tons. It may be worked by horse power, if desired, although steam is much more convenient. This crane was patented by B. J. Burnett, of Mount

receive the lateral pressure caused by the load, is concealed by the base on which the machinery stands; it consists of a circular way around the column, around which there are friction rollers arranged in a frame, which travels around the column half as fast as the revolving base of the jib, D, travels around it. Outside the rollers is a strong ring, bolted to the base of the frame, A, on which the working machinery and boiler are fixed. The anti-friction balls at the top and the anti-friction rollers around the column near the bottom,

MARIPOSA COUNTY.—The Mariposa Free Press of August 18th has an interesting editorial in regard to the mines in Mariposa county, "outside the Grant." It says that of the 170 stamps on the Grant, only eighty-eight are now running; while outside there are not less than 250 now in operation. The list of mills, with the names of owners and number of stamps to each, is too long for our space. The "Great Main Quartz Vein" runs through this county, cropping out also in Tuolumne and Calaveras. The celebrated Pine Tree

A VERY PROPER SUGGESTION.—Dr. D. G. Macgowan, who is now traveling over the State with the view of more thoroughly acquainting himself with its resources, while recently viewing the Alpine grandeur of the Sierra Nevada, from a prominent point on the route of the Pacific Railroad, was terribly shocked to learn that a noted "pass" in the mountain, near by, was designated "Jehovah Gap." It appears that the place was originally called "Devil's Gap;" but the railroad company thinking to improve the nomenclature, had changed it to "Jehovah Gap." The Doctor earnestly remonstrated with his friend against such a palpable violence to good taste, and the religious sentiment of the community, as to make such an unwarrantable use of the ineffable name. It is conceded by the public that the officers of the Central Pacific Railroad are fully entitled to give names to all prominent places along the line of the road; but we join with the Doctor in the earnest entreaty, that so respectable a body as the officers of that road—a body which partakes of a national official character—will not vie with the least reflective of our population in a fault which has justly brought upon us, as a people, most severe animadversions from strangers and foreign tourists.

WHAT IS IT?—Some two weeks since, says the Santa Cruz Sentinel, Mr. W. T. Hunter had a well dug on his premises, near Portrero street, where the cemetery gate is located. The workmen, when down some fifteen feet, discovered a strata of sand-clay, containing a substance very similar to indigo. The substance is in blue balls, about the size of indigo balls, and quite light for a mineral substance. The color is a deep, ultra-marine blue, of pure body and tint, without any foreign substance, such as sand or clay. In some instances the balls had been broken, and the coloring was thoroughly permeated in the earth. As the indigo strata is lateral, the mineral was probably removed from the main ledge, in the adjoining bill, by a land-slide, earthquake or other disturbance. It is thought a little prospecting would discover the ledge. If some one will send us a sample, free of cost, we will furnish him with the name and general characteristic of the mineral.

GEORGE T. PRACY, at his new machine works on Mission street, between Maia and Spear, is better prepared than ever before to accommodate his patrons with good work.

FOR OUR CABINET.—A fine lot of specimens for our cabinet have been received from Nye county, Nevada, which will be more fully noticed next week.

BURNETT'S PATENT STEAM CRANE.

Vernon, N. Y. The American Artisan furnishes us the following careful description of the machine and its operations:

"The foundation plate and supporting column of this crane are marked C and B in the engraving. The circular plate, C, is to give a wide base. The conical column, B, is bolted down upon it; and the whole is stiffened by vertical webs. The weight of the movable part of the crane, with its load, is borne on the top of the column, inside of which is a circular groove containing twelve 3-inch balls to lessen the friction. A pivot gudgeon, forged upon the top of the frame, A, projects downward into a step, to bear the lateral pressure caused by the load. The bottom bearing, to

make it easy to swing the crane with its load. The steam cylinder, and the train of gear wheels, and the lifting chains, are shown in the engravings, and need no description. The base-plate, A, is for light work when there is no steam in the boiler; and this crank may be shifted to the wheel, H, when quick motion is required. Around the wheel, K, is a brake, consisting of an iron strap, which is tightened by a hand-wheel. The boiler helps to balance the load suspended under the jib, and swings around when the load swings.

PATENT REPORTS.—We are indebted to Hon. Wm. M. Stewart for volumes one and two of the Patent Office reports for 1863.

and Josephine mines are upon it; so, also, the Crown Lead. The district is about fifty miles in length and ten in breadth. The portion near Coulterville is of late attracting the attention of capitalists. We give a few items from the article above referred to: Doaglaes & Co., at Horse Shoe Bend, have been taking out \$20,000 a year with a band-mortar. Hughes & Williams, at Flyaway, are working a clay vein, and making from sixty to eighty dollars per week. Two five-stamp mills belonging to H. G. Cowan have been yielding immensely for the last two or three years. One of these is at Gentry's, and the other at the North Fork. Several gold-bearing veins at Hunter's Valley are now being profitably worked. In the neighborhood of Quartzburg and Hornitos there is a perfect network of quartz veins—most of them pocket veins, some of them decomposed. Miners are constantly at work with picks and hand-mortars, and the finding of "chispas" of several ounces weight is no extraordinary occurrence.

CHEMICALS.—It is said that the stock of chemicals and acids in this city is unusually large at the present time. This is due to a variety of causes. The sales of the last year have largely fallen off from that of several years previous, by reason of the decreased demand therefor by the mills of the interior. The cause of the decreased demand for chemicals and acids is attributed to the changes that have recently been made in the processes of separation and amalgamation of the precious metals. For sal ammoniac, the Washoe mills are now using common salt, obtained in that State. The use of sulphate of iron, copper, etc., is being gradually discarded for more economical substitutes. The stock on hand is being largely increased by frequent arrivals from the East, and a great number of shipments are still on the way. Quite a large amount of chemicals, also, is now being manufactured both in this State and Nevada.

THE OLDEST LAND.—Professor Agassiz says that the strip of highlands which divides the waters flowing into the St. Lawrence from those flowing into the Atlantic, is probably the oldest land in the world. If so, it was once a lonely sea beach, washed by a universal ocean.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Notes on the Chief Gold Districts Throughout the World.

BY PROFESSOR ROWLANDSON, F. O. S. L.

[Continued on Page 93.]

ASIA.

Allusioo has already been made to the auriferous district of the Ural mountains, which forms the dividing ridge between Europe and Asia. The gold region, however, is almost if not entirely confined to the Asiatic side. At the same time a brief notice was made of the Altaic mountains, based on some remarks made by Sir Roderick Murchison, in reference to a posthumous work of the late Mr. Atkinson. The remarks then made need not be repeated, especially as they will most probably again have to be referred to in drawing up a brief summary.

The great central plateau of Asia is still almost a geographical *terra incognita*, whilst of its geology we absolutely know nothing, from the northern water-sheet of the Himalahs to the Altai and Ural mountains, and from the Pacific border of China to the Kergis Steppes. If, however, we admit what is in the highest degree probable, that oceanic waters extended continuously, within a comparatively recent period, from the Atlantic to what is now called the Sea of Aral, in Central Asia, from which seabed has been deposited rocks resembling those found surrounding the Caspian, there can scarcely exist a doubt that the metalliferous rocks, containing gold, silver, copper, or any other metal, must be of very recent age. A wild, rocky, and mountainous country exists on the eastern and northern border of China, separating the lower flat and sea-board portions of that Empire from the Tartary and Central Steppes and deserts of this continent, the age of which has been undetermined, and in which minerals, auriferous and argentiferous, are said to be not unfrequently found. At the early period of studying this subject, or more than twenty years ago, I was led from the fact that silver, the product of the region under notice, owing to the amount of gold present, was worth two dollars per ounce; that the ore must have been obtained from rocks of the paleozoic age; for up to that period, and for a long time afterwards, I had tangible evidence that gold had been discovered in rocks of a more recent date than those associated with the primary sedimentary series; although I soon afterwards had strong reason to suspect, from the examination of ores obtained from South and Central America, Mexico, etc., and comparing the accounts which accompanied them of the rocks from which the specimens had been derived, that when a more accurate examination of the geology of the countries named had been made, it would be found that these celebrated districts for the production of the precious metals consisted not only of the older, but also of the secondary and probably still more recent rocks.

The observations made and reported by Mr. R. Pumpelly, on the geology of the interior of China, tend to show that the more recent rocks predominate in geographical area, compared with those of paleozoic time. It is to be regretted that Mr. Pumpelly has not given us even a brief account of the geology of the Japanese group, or, at all events, such portions thereof as fell under his immediate observation, as gold has undoubtedly been found of very fine quality and in pieces of considerable size in Japan; though probably its chief auriferous produce is possibly considerably alloyed with silver, usually in proportion not greatly varying from that of "electrum."

The specimens of coal and lignites hitherto derived from Japan tend to the inference that they are referable to cretaceous and tertiary ages, whilst its active volcanic system, both in form and general characteristics, bear a strong resemblance to that found in the South American Cordilleras.

INDIA, MALACCA, ETC.

Notwithstanding the long established popular impression of the immense metallic and jeweled wealth of the Orient India, Hindostan proper is but very sparsely furnished with mines capable of yielding the precious metals in paying quantities, even though worked by means of the cheap labor of its redundant population. The Burdwan coal-field has generally been considered as belonging to secondary rocks, and has usually been compared with the carboniferous beds of Australia, which have also generally been assigned to the secondary system. On this point, however, as regards both countries, the evidences in support of the view just set forth have rather been considered as strongly conducing thereto rather than being conclusive. Seeing that gold has been found in Nepal, high up in the Himalahs, and that a large part of the mountain is composed of and generally capped by rocks of tertiary age, as well as that the matrix of the celebrated diamond mines of Golconda is formed of rocks more modern than the paleozoic era, in the absence of proof to the contrary, it is not an unfair inference that when worked out, the gold-producing rocks of India will be found, as in California, and probably in many other parts of the world, to consist of secondary or even more recently formed strata.

The peninsula of Malacca probably affords more marked evidences of the geologically modern era of gold-producing rocks, than India proper; a like remark applies also to the neighboring extensive islands of Ceylon, Sumatra, Java, Borneo, the Manilas, etc., etc., some of which, from existing plutonic action, bear a strong resemblance to what is simultaneously occurring on Central and the Western coast of South America.

AFRICA.

So very little is correctly known of the geology of this continent that a brief space only will be required to describe its features as regards gold-bearing rocks. All accounts concur that the northern part of this division of the earth, commencing on the Atlantic with the kingdom of Morocco, and proceeding along the Atlantic and Mediterranean sea-board to the embouchure of the Nile, and thence southerly across Egypt and continuously by the western margin of the Red Sea and the coast of the Indian Ocean, until the equator is approached, consists chiefly of secondary and tertiary rocks, and at different points along this extended line gold has been found in various ages. The most celebrated amongst the ancient memorabilia connected with this subject, in the land of Ophir, which has recently been pretty well determined to be situated not far from the Straits of Bab-el-Mandeb. Respecting the western equatorial coast of this continent, commonly called the Gold Coast, the coinage of the gold from which has given the name of "guinea" to a British coin of \$5.25 value, I am not aware that any information exists respecting the geology of the country from which it is derived,—not even as respects the country bordering the Atlantic—the latter, even if known, would however go a very little way toward elucidating the subject, as I have been informed by a great number of African traders, of whom I have made personal inquiries, that the ivory and gold purchased on this coast is brought from the interior, in some instances from a considerable distance, and that of the character of the country from which the gold was procured originally, no information had ever been obtained, or, in fact, even sought.

Respecting South Africa, namely, the vicinity of the Cape of Good Hope, Natal, Namaqualand, etc., in each of which gold has been found, secondary rocks have so far been found to occupy by much the larger area of the lands hitherto noticed with geological objects in view. A large part of Natal and Namaqualand, as I have been informed from private sources, is composed of a metamorphosed rock not greatly dissimilar to what is found so extensively in Calaveras county, and extending into Amador and El Dorado counties on the one side, and Tuolumne and Mariposa on the other. The comparison holds good in another respect, namely, that in the African district, as in Tuolumne county, large "table mountains" exist, capped with beds of basaltic matter of immense thickness, which must at one time have extended continuously for upwards of one hundred miles, though now broken into segments by intervening valleys, formed by denuding forces.

These remarks are only made in order to draw attention to the general similarity of character, so far as yet known, between California and Southern Africa. As respects the probable future gold-producing capacity of the two districts, the comparison is immensely in favor of California, for, so far as information has been obtained up to the present period, the gold-bearing quartz rocks of Southern Africa are sparse and irregular, and in a general way somewhat unproductive. The indications for copper, especially along the Orange River, are, however, much more promising.

[To be Continued.]

[Written for the Mining and Scientific Press.]

The Patera Process in Lower California.

EDITORS. PRESS: Some months ago, there appeared in the columns of the PRESS, the statement that certain parties in Lower California had adopted the Patera process for beneficiating the silver ores of that country, and it called forth an article from the pen of G. Kastel, I think, in which that process was spoken rather favorably of. I know something of the history of that experiment, and, for the benefit of those who feel an interest in it, will state that the announcement of its success was premature. It was abandoned after a short trial.

A test, which succeeded perfectly, had been made upon about a ton of the concentrated heavy sulphurets from the Santa Cruz mine; but when it was attempted on a larger scale, and on unconcentrated ore from the same mine, it was found that, notwithstanding the leaching of the roasted ore with hot water, there remained a large quantity of matter, soluble in the cold solution of hyposulphite of soda, in consequence of which, the leaching with the latter required a very long time; the precipitation consumed an enormous quantity of solution of polysulphide of sodium, and finally the precipitate contained so much arsenic, lead and antimony, that the extraction of the silver from it was almost as costly and difficult as from the original ore; besides which, the residues, or tailings, retained a large proportion of the silver originally present.

I myself repeated the experiment more than once on a small scale, with the same and other ore, which I had roasted for amalgamation, with similar results. In fact the ores of Lower California, in general, are not fit for the process; they are of the class called "rebellious," in a high degree, and they almost invariably contain a great deal of arsenic and antimony, more or less zinc, and from one-half to twenty per cent. of lead. The gangue, in the district of San Antonio, is usually calcareous, with but little quartz. The gentleman who made the experiment, deserve great credit for their perseverance, as they did not give it up until a thorough trial, and the outlay of a large sum of money had convinced them that it would not answer. Neither of them was experienced in metallurgy, otherwise the attempt would probably not have been made on such ores. They fell into the too common error of basing calculations on the result of a test made under conditions which could not profitably be maintained on a large scale.

On replacing the amalgamating pans, warned by the past, they engaged an amalgamator, one of that class of "mushroom assayers," so designated by an indignant correspondent of the PRESS, some time since, to whose growth in large numbers the exigencies of the Pacific coast have given rise. A mushroom is better than a fungus, even though the former has sprung up in a single night, and the latter be the slow growth of years on some old log in the Fatherland, and our California and Washoean metallurgists have been more successful, at least in Mexico, than those imported from Europe. Accordingly the little four-stamp Picacho mill immediately began to pay a handsome dividend to the lessees, and continues doing so to this day, which is more than its big sister of the Triunfo has ever done yet.

I believe that a good mill, capable of working two tons daily, would pay well in Lower California. A significant fact is, that one Flores, a Mexican, who has for some years past been extracting ores exclusively for exportation, has grown rich thereby, though his mines are badly worked, and not richer than many others in the vicinity. DON CARLOS.

STRAID ON COMMON ROADS.—The employment of steam on common roads is fast becoming a success. A gigantic road locomotive, for carrying freight, has recently been put at work at the quarries at Newcastle, County Down, Ireland. The works of the machine are massive and elaborate, and it is calculated to carry eighty tons with ease.

Copper Ore Shipments and Sales.

The shipments of copper ore to Swansea from this city since January 1st, 1866, have been 3,240 tons. Another vessel is now loading for the same destination. This is a much larger amount than has ever before been shipped during a like period. These shipments, it will be observed, do not include that which has gone to Atlantic ports.

The price of copper ore has declined very materially during the period alluded to. For the purpose of showing the amount of this decline from November 10, 1865, to July 10, 1866, we append the following report of sales made upon the dates given:

	Nov. 10, 1865.	July 10, 1866.
10 per cent. ore.....	\$41.50	\$33.87
17½ per cent. ore.....	66.62	58.75
21 per cent. ore.....	91.62	67.62

The latest advices from Swansea report a sale of 2,703 tons of copper ore, sold in lots, assaying all the way from 3¼ to 69 per cent.—the former selling for \$7 or 1.86 cts. per cent.; the latter selling for \$27.87, or 3.30 cts. per cent. of copper.

Ores assaying 20 per cent. has been sold in this city within the past four days for \$52 per ton. The value per ton, in Swansea, July 10, 1866, for 20½ per cent. ore, was \$63.28, leaving a margin of only \$11.28 per ton over the price in this city, for freight, insurance, interest, commission and incidental expenses, including cost of sampling and assaying, both here and in Swansea. The California miner will see from this statement that there is a very small margin for a profit to the buyer here. If we estimate California interest, at two per cent. per month, for the ten months delay between the sale here and sale day in Swansea, the interest alone would more than absorb the entire difference, leaving nothing for freight, etc.

Sales of copper ore take place in Swansea every week. The ores are sampled one week before the sale, so that parties wishing to buy, may ascertain from their own assayers what per cent. of copper the several lots will yield. Sealed bids are then received for the several lots, and the party making the highest bid secures the ore. This system of sales will doubtless be inaugurated in this city, as soon as the receipts of ore here shall be regular and sufficient in amount. It would be much better, for all parties, than the present system of hawking samples about for purchasers. A large lot of California ores was offered for sale in Swansea, on the 17th ult., the results of which have not yet been received in this city, at least not by mail.

GREAT PRODUCTION OF PRECIOUS METALS. A London commercial journal gives the estimated value of the gold and silver production of the world in 1864 at £67,610,000, or about \$335,000,000, of which \$112,000,000 are set down to the United States, by far the heaviest producer of the precious metals in the world. The San Francisco Bulletin estimates that in the last sixteen years there has been produced in the world \$5,000,000,000 worth of bullion. The estimate is undoubtedly too large, but whatever it is, it has given a great impetus to trade, which will be still further accelerated by the floods of bullion that will be poured forth from the extended mineral region of the United States.

CHEAP ICE PITCHER.—The following simple mode of keeping ice-water cold for a long time in a common pitcher is worth knowing: Place between two sheets of paper (newspaper will answer, thick brown is better) a layer of cotton batting, about half an inch in thickness; fasten the opposite ends of paper and batting together, forming a hollow cylinder, then sew or paste a cover over one end, making a box the shape of a stovepipe hat, minus the rim. Place this over an ordinary pitcher filled with ice-water—making it deep enough to rest on the table so as to exclude the air—and the reader will be astonished at the length of time his ice will keep, and the water remain cold after the ice has melted.

Boston papers claim that the statuary of their town in a few years will be ahead of anything in America.

Mechanical.

A NEW ALLOY—IRON IN BRASS.

Dr. Grace Calvert, in a recent lecture, remarked that he as well as several other experimenters, had observed that the addition of a small quantity of iron to brass, which is ordinarily considered an impurity, completely modifies, and, for some purposes, greatly improves the properties of that alloy. A brass composed of 40 per cent. of zinc and 60 per cent. of copper, can be readily drawn or bent when cold, but cannot be forged or worked when heated; while if $1\frac{3}{4}$ to 2 per cent. of iron be substituted for a like per centage of the zinc, a character of brass is obtained which possesses the valuable property of being forged at a red heat, like iron; and its tenacity is at the same time increased in an enormous proportion, as compared with a brass destitute of iron in its composition. The Doctor says that each square inch of surface of this new alloy is capable of supporting a "breaking weight" of from 27 to 28 tons—a tenacity nearly equal to that of iron.

Messrs. Beyer & Peacock, of Manchester, who experimented with bolts made of this alloy, in the hope of substituting them for iron ones in the fire-boxes of locomotives, found that the bolts would support a strain equal to those of iron, and that the threads of the screw were not stripped with more facility than those of iron, when exposed to the same strain.

MIXED IRON FOR STEAM CYLINDERS, ETC. A mixture of hematite iron with Bessemer steel has been used in England, in the manufacture of steam cylinders for high-pressure engines, and has been found a great improvement over the iron ordinarily used. It adds greatly to the strength of the cylinder to the given weight of metal. Quite too little attention is given, by practical mechanics, to the employment of mixed iron for various purposes, where economy in cost, with lightness, compactness and strength is desirable. The wonderfully strengthening qualities of tungsten and titanium must eventually be brought into practical use for steam boilers, and for iron for steamboat shafts and steam chests, as well as its hardening qualities for various purposes where great friction and wear is encountered, as in quartz mill stamps, shoes and dies for amalgamating pans, for car wheels, railroad-car axles, etc.

IMPROVEMENTS IN FURNACES FOR CASTING IRON.—Some idea of the improvements which have been made in iron foundries within the past fifty years, may be inferred from the fact that Mr. Ireland, an iron founder of Manchester, England, was thought to have performed wonders in 1809 when he succeeded in melting a single ton of iron in *ten hours*. The same gentleman now melts *thirteen tons* per hour, with a single 4-foot cupola, and a portable one at that.

TO SOLDER STEEL UPON STEEL, the following ingredients, finely pulverized, have been recommended: Boracic acid, 41 pounds; dried sea-salt, 35 pounds; yellow prussiate of potassa, 15 parts; dried carbonate of soda, 8 parts. Or dissolve phosphorus in nitric acid; evaporate the solution to the consistency of thick sirup, and add one or two volumes of alcohol at 80 degrees; apply it to the steel with a brush, or dip the metal into it.

TO CUT IRON.—There are many circumstances under which the following method may be advantageously adopted for cutting iron: Heat your iron bar to whiteness, then with a common saw you can cut it as easily as a hot knife cuts butter. The edge of the saw will not be injured; and the ends of the bar, at the place of division, will be smooth—a result not attainable when the bar is cut with a chisel.

STEEL FROM IRON SCRAPS.—If iron scraps in small pieces are put into a crucible at the rate of forty pounds to eight ounces of charcoal and four ounces of black oxide of manganese, and exposed for an hour and a half to a high heat, and then run into molds, good steel may be made.

PORTABLE FOUNDRIES

Among the latest mechanical novelties attempted in England, is a "portable foundry;" not, as one would suppose, for doing light work, but for accomplishing the very heaviest class of work which such establishments are called upon to turn out. In fact, the great inconvenience, if not absolute impossibility, of transporting heavy castings, is the very consideration which has brought about this novelty in mechanical operations. Mr. Ireland, a distinguished iron-founder of Manchester, is the individual who has conceived the idea, and he intends to make it a specialty in his business. He has constructed a cupola, four feet in diameter within the lining, and twelve feet deep from the charging floor. His blast is introduced by means of a hollow iron belt or band two feet nine inches broad, which surrounds the cylinder, about seven feet from the ground. This belt contains two rows of tuyeres, one opening into the cupola from near the upper portion of the belt, the other from the lower portion. The upper row of tuyeres consists of sixteen orifices three inches in diameter; the lower one contains but four tuyeres, each eight inches in diameter, placed opposite each other. The blast is delivered into the lower portion of the belt, in range with the lower row of tuyeres, but at regular intervals between them. By this arrangement, it is said that the blast is very equally distributed throughout all the tuyeres. The upper row does most of its work around the edges of the mass—the blast not penetrating very far into the fuel; while the larger volume of the lower row forces the air quite into the center of the diameter of the cupola. The air is thus very equally diffused through the entire mass of fuel.

Mr. Ireland finds that with a blast pressure equal to sixteen inches of water on this cupola, he can run down thirteen tons of iron per hour. By the use of two such cupolas, he has recently cast an anvil block weighing 205 tons, running his iron at the rate of twenty-five tons per hour. He employs coke, and uses an amount but little in excess of one ton of fuel to a ton of iron.

When this cupola is to be moved, the lining is taken out for separate conveyance, when the shell of the cupola can be easily transported, set up and re-lined at a trifling cost, to what would be incurred for moving in one piece such huge castings as are now frequently called for. The furnace can be set up directly at the spot where the casting is wanted, and the power for the blast taken from any portable engine, or a stationary one if near by. A little reflection will at once convince any person of the feasibility and utility of the plan, and Mr. Ireland is deserving of much commendation for his happy idea. By the aid of the portable engine a cupola may be set to work anywhere at a few hours' notice, and its transport, and that of the pig iron and fuel, would usually come cheaper than that of a casting weighing very much less than a heavy anvil block.

"It is out of the question," says the *London Engineer*, in commenting upon the utility of the portable foundry, "to think of casting such masses [as heavy anvil blocks, etc.] at a distance, within the walls of an ordinary foundry, and then removing them to their permanent destination. The handling of such unwieldy blocks is an excessively expensive task, while their carriage over considerable distances is next to impossible. They cannot be conveyed by rail, and no vessels but those specially constructed for the purpose could take one as cargo. Some time since a casting, the basin for a large public fountain in one of the London markets, was made in one of our Midland towns. It weighed not much over, if so much, as the fifth part of Mr. Bessemer's anvil block. One of its first performances, nevertheless, was to break through a bridge spanning a narrow stream, while being conveyed by horses to a seaport town. Immense trouble and expense were incurred before it was rescued from this predicament. On its arrival in London it was found that, although required at the east end, no crane of sufficient power to land it existed down the river, and it was ultimately landed near the west end, and hauled by horses at dead of eight through the streets. A very little more weight would have effectually set all attempts at conveyance at defiance."

Scientific Miscellany.

MOVEMENT OF SOUND.—Under a calm condition of the atmosphere, sounds have been heard at great distances. Dr. F. C. Robinson asserts that the report of artillery at the battle of Gettysburg, Pa., was distinctly heard by himself and many other citizens at Greensburg, in the same State—a distance of 125 miles from the battle-field.

The velocity of sound in common river water, at a temperature of 15° centigrade, is 4,700 feet a second, while at a temperature of 30° centigrade it is 5,000 feet a second. In solids the velocity is much greater than in liquids. In fir-wood, for example, it is 15,000 feet a second; in iron, it is 17,000; in lead, however, it is only 4,000 feet a second.

When sixteen vibrations or sounds reach the ear in a second they produce the sensation of a musical note of the lowest pitch which the ear is capable of appreciating. When 32,000 reach the ear in a second, the note produced is the highest which the human ear is capable of appreciating. Any number of sounds or vibrations less than sixteen in a second, convey no idea of music to the brain.

CAUSE OF CEMENTS SETTING UNDER WATER. M. Fremy recently read a paper before the French Academy of Sciences, detailing some of his "Chemical Researches on Hydraulic Cements." The paper is of considerable industrial importance; but we will merely give at this time the author's conclusions as to the cause of the setting of the cements under water. This results, he says, from two different chemical actions. In this one the aluminate of lime becomes hydrated, and in the other hydrated lime combines with the silicates. The aluminates and the calcareous silicates, the author believes, play different parts in the setting; the former simply become hydrated, the latter combine with hydrate of lime. In a future number we may give an abstract of the experiments described by the author.

CHALK DEPOSITS.—A portion of the mud brought up from the bottom of the Atlantic in the attempt to grapple for the cable a year ago, has been analyzed. It presents such appearances as would lead to the inference that a bed of chalk is in process of formation under that part of the Atlantic ocean, and affords a practical illustration of the manner of the formation of the chalk beds of the earth.

TO DISSOLVE SILK.—It is said that silk can be dissolved in a neutral solution of chloride of zinc, concentrated to about 60° of the areometer. The process of solution is similar to that of dissolving guacotton in alcoholized ether. M. Persoz, the eminent French chemist, is the discoverer of this remarkable fact.

INFLUENCE OF THE LIGHTNING ROD.—A French electrician, M. Charles, says that a lightning-rod protects a circular space (around the rod), the radius of which is equal to twice the height of the rod above the roof of the building to which it is attached. According to this theory, if a rod extends ten feet above the top of a house, it protects a circular space of forty feet in diameter.

IMITATION VELLUM.—It is said that imitation vellum can be made by immersing white paper in strong sulphuric acid that has been diluted with half its bulk of water and allowed to cool. When washed freely—first in water and secondly in weak ammonia—the paper becomes so tough that a band of it, one inch in width, will support a weight of 125 pounds, while a similarly-shaped piece of the unprepared paper will break under a weight of eight pounds.

EFFECTS OF HEAT ON CRYSTALLIZATION.—M. Kuhlmann, in a communication to the French Academy of Sciences, about a year ago, on his "Researches on the Crystallogenic Force," states that crystals produced at a low temperature have forms different from those produced at the ordinary temperature, and are capable of holding much more water. This latter property is not confined to ordinary salts, but extends to sugar, oxalic acid, and other crystallizable organic matters.

WHY BOILING MILK FOAMS.—When milk is boiled its volume is very much enlarged, while water merely bubbles without any increase in bulk; why is it that the two liquids under the same circumstances behave so differently? When water is gradually heated to the boiling point the portion nearest the fire first reaches the temperature of 212°, and the first particle that is heated to this degree is immediately converted into steam. As in its new form its volume is about 1,700 fold greater than in the liquid state, while its weight remains the same, it floats upward through the water, being held in a nearly spherical shape by the nearly equal pressure of water against it upon all sides. When it reaches the surface it is lighter than air, and consequently floats away in the atmosphere, and being invisible it is lost to our sight. The rapid formation of these little globes of steam, and their rising produces that peculiar disturbance of the liquid which we call ebullition or boiling. When milk is boiled the same little globes of steam are formed, but their surfaces are coated with an exceedingly thin film of the case in which is one of the constituents of milk, and which has sufficient tenacity to prevent the bubbles from breaking when they reach the surface, or from being separated from the liquid. They consequently accumulate as they successively rise to the surface, forming the white foam which so frequently flows over the edge of the vessel into the fire.

SOME FACTS IN NATURAL SCIENCE.—According to the French chemist, Lavoisier, the human body exhales about three and one-half pounds of aqueous matter daily. A large cabbage has been forced to exhale twenty ounces of water from its surface.

If the surface of a frog be covered with oil it will speedily die, so important to its existence is the cutaneous respiration. The lungs of a frog can only be filled with air by an action resembling swallowing. Sea-weeds absorb their food by their whole surface, the so-called roots appearing only to serve the purpose of attachments.

The poison of the most venomous serpents may be taken into a healthy stomach without injury, but the smallest portion introduced into the circulating system may produce speedy death.

All food for plants must be so divided as to be able to pass through a cellular membrane. The roots of plants are never provided with open mouths. There is no plant that does not furnish support to some animal.

CHIMOGÈNE—A NEW ANESTHETIC.—Prof. Vanderweyde, in the *Dental Cosmos* says: "In experimenting with the highly volatile and gaseous products of distillation, I succeeded in producing a liquid boiling at any desired degree of temperature, say at 60°, 50°, 40°, or even at 30° Fah., causing, by its evaporation, the most intense cold. I propose therefore to call it *Chimogene* (cold generator)."

The desired degree of its boiling point depends on a slight modification in its preparation; in fact, it may be made so volatile that it requires very strong bottles and careful stoppering to hold it, as by lifting the stopper it foams like champagne, boiling at the common temperature; pouring it from the bottle in drops or in a small stream, it will be evaporated before reaching the floor.

Having just read, on page 601, of the last number of the *Dental Cosmos*, the remarks about the want of such a liquid for anesthetic purposes, it struck me that this was the very thing needed, and I hasten, therefore, to bring this discovery to the knowledge of the profession.

SINGULAR VEGETABLE ACTION.—Carefully conducted experiments, it is said, have shown that many vegetables are absolutely gainer by the more close connection with plants of another habit than their own; for instance, potatoes and cabbages, tobacco and turnips, onions and lettuce, cucumbers and radishes, peas and parsley, beets and bell-peppers, egg-plants and summer savory.

In the course of some studies on the formation of turf, M. Vohl sealed up a mass of moistened chestnut leaves in an earthen pot and left it to decompose. After nine years the author examined the earthy mass which resulted. It was first exhausted of water, and the residue was then treated with a mixture of alcohol and ether. The latter solution, on evaporation, left a residue of wax and chlorophyll, showing that nine years of putrefaction in the absence of light had not altered the coloring matter of the leaves.

OZONE.—The presence of ozone in the atmosphere is a subject of dispute, and a commission has been appointed by the French Academy of Sciences to investigate the question.

The diminution of the magnetic dip has been going on in London for the last half century, with great regularity, at the rate of about three minutes annually.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, Sept. 1st, 1866.

We have been at some pains to collect the following facts in regard to the local insurance companies of this city:

Pacific.—According to their third annual statement, embracing operations from June 30th, 1865, to July 1st, 1866, this Company had, at the latter date, assets amounting to \$1,113,862.82. The total income for this period sums up \$504,326.11, and their disbursements amounted to \$358,550.13. Fire risks written up during the year, \$15,804,328; Marine risks, from August 1, 1865, to date of report, \$5,450,816. Risks in force, June 30, 1866—Fire, \$13,634,150; Marine, \$1,209,121.

San Francisco.—In July last, this Company increased its capital stock from \$150,000 to \$300,000, consisting of 3,000 shares of \$100 each. Their assets at this time amount to about \$350,000.

Occidental.—The stock of this Company has been changed from 300 shares at \$1,000 each, to 3,000 at \$100—full paid. Their assets, at the close of July, amounted to \$338,000.

Union.—At the date of their annual report, April 30th, the assets of this Company amounted to \$852,911.20, and on July 31st, \$835,874.83—less dividends. A dividend of 2 ½ cent. per month on the capital stock was paid for the months of May and June. Quarterly dividends will be declared hereafter in the months of October, January, April, and July.

Merchants' Mutual.—The shares of this Company have been increased to 1,000, and the stock has been reduced from \$5,000 per share, to \$500. Sixty per cent. of the capital stock has been paid in. Assets, August 1st, \$312,000.

In this connection we append the following statement, showing the assets of the different local companies for the past months of the present year, as compared with the annual returns made December 31st, 1865. It will be noticed that an additional company—the National—has been organized since that time, and is embraced in this list:

NAME.	Date.	Assets.	Assets on Dec. 31st, 1865.	Increase.
Pacific	July 1	\$1,113,862.82	\$1,051,420.37	\$62,442.45
National	August 31	850,000.00	—	850,000.00
Union	July 31	835,874.83	502,461.04	333,413.79
Fireman's Fund	June 30	681,577.00	635,373.74	46,203.26
San Francisco	July 1	350,000.00	275,806.92	74,193.08
Occidental	July 1	338,000.00	75,800.41	262,199.59
San Francisco Home	July 1	325,000.00	306,032.41	18,967.59
Merchants' Mutual Marine	August 1	312,000.00	287,201.85	24,798.15
California	July 31	289,737.00	242,990.19	46,746.81
Home Mutual	No Report	—	—	—
Totals		\$5,096,371.65	\$3,377,088.91	\$1,719,282.72

If we take from the aggregate assets, as reported above, the sum of \$850,000 (comprising the amount of assets held by the National Insurance Company) we find a gain of \$869,282.72, as against the total assets reported 31st of last December. Including the \$850,000 as an increase of assets, we have a total increase of \$1,719,282.72 by the nine companies designated in the above statement.

The Mining Share Market during the past week, with but few exceptions, has been characterized by extreme dullness, most stocks having declined from previous quotations.

Hale & Norcross continues inactive but is firmly held, meeting with small sales at \$1,600, h. 30. From the 1st to the 28th ult., 2,391 tons of ore were sent to different mills, yielding \$118,000, or an average of about \$50 per ton.

Savage has been dealt in to some extent, declining from \$1,160 to \$1,100, rose to \$1,105, receded to \$1,070, rallied again to \$1,090, and sold yesterday at \$1,085. During the week ending August 25th,

975 tons of ore have been extracted, and 1,060 tons were shipped from the mine. The south face of the drift, sixth station, continues in ore, inclining rapidly to the westward. North body, same level, has contracted very much, but overhead is still looking very well. The east cross-cut through the Potosi chimney develops but little ore. The south winze, from the 5th station, has been sunk to a depth of 14 feet, the last few feet in good ore. Considerable water is met with at this depth and work has been suspended for the present. The drift from the 7th station is in 82 feet from the shaft—the rock is hard and work progresses slowly. Little has been done in the southwest drift of the Curtis shaft; the west drift looks very well. Receipts of bullion during the month of August amounted to \$145,000.

Crowa Point has met with few sales, receding from \$950 to \$935. For the week ending August 26th, 649 tons of ore have been raised from the mine. The drift on the 400-foot station, is in 170 feet. The Rhode Island mill is now crushing about 50 tons of ore per day. No important change to note in the mine. The yield of bullion last month amounted to some \$80,000.

Gould & Curry is in little request, and but few feet changed hands the past week, declining from \$720 to \$710, and quoted yesterday at \$700. The small deposits of rich ore discovered recently in the drift from the Roaner shaft—2d station—continue as work progresses in the incline. The prospects of leading down into a large body of the same quality of ore are thought to be very good, and an average assay shows a yield of \$485 to the ton. The incline is now in porphyry and is likely to continue so to the 100 feet for which they are sinking. The drifts on the 4th station show no change. Receipts of bullion for the month of August amounted to \$120,000.

Yellow Jacket has improved, opening at \$730, receding to \$710, advancing to 745, and selling yesterday at \$730. For the week closing Monday, 27th ult., 38 tons of first-class and 2,450 tons of second-class ore were extracted from the mine, and the yield of bullion exceeded \$92,000, making an aggregate of \$246,500 for the first four weeks of August.

Ophir has been dealt in to the extent of over 100 feet, ranging from \$210 to \$221, closing at \$210 bid. There is nothing of any interest to note from this claim.

Chollar-Potosi declined from \$178 to \$142, closing yesterday at \$129. During the past week 534 tons of ore were sent to custom mills. From the 485-foot level, in the Potosi ground, 100 tons of ore of an inferior quality were extracted, but better results are shortly expected. The new engine is now being placed in position. The decline in this stock the past week has been in part attributed to the rumor that an assessment would soon be levied; but this is not likely to occur with a balance of \$40,000 in the treasury of the company.

Belcher has also met with a decline, advancing early in the week from \$155 to \$162, declining to \$145, s. 20, and closing yesterday at \$125. Empire Mill and M. Co., receded from \$110 to \$97½, closed at \$103 per share.

Imperial has been well maintained, at \$97/98, closing at \$95 per share. During the first three weeks of August the receipts of bullion amounted to \$48,000, and will probably aggregate \$80,000 for the entire month. The improvements in the ore of the Alta mine noted for some time past, now apply to that found in the Holmes' ground, which latter, it is thought, is yielding some \$30 per ton.

Overman receded from last quotations, fluctuating within a range of \$22¼/16, and closed at \$11½. An assessment of \$15 was levied on the 24th of August. Confidence sold yesterday at \$43. Bullion receded from \$28 to \$24½, closing at \$20.

Legal Tender Notes to the amount of \$55,000 were dealt in the past week, advancing from 71 to 72½c, b. 30, receding to 70½, and selling yesterday at 71½.

Our latest telegraphic advices quote gold at the East at 148 on the 30th ultimo.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday, amounted to \$322,729.75.

Mining Summary.

CALIFORNIA.

Alpine County—

From the Silver Mountain *Bulletin* of August 18th we clip the following items: The main lode in the George Washington company's claim has been struck, revealing a vein of ore four feet in thickness, as rich as any from the Savage or Gould & Curry. Speculations regarding the permanency of this lode or of its value have merged into a certainty. Ores of the first quality can now be readily obtained in sufficient quantities to keep a 10-stamp mill in constant operation. . . . California Illinois Company, Raymond district, have gone through their adamantine formation, and struck into a softer formation of the same material, and are now enabled to make two feet each shift.

The "corner stone" of the George Washington company's mill was laid on the 13th, with ceremony. The occasion was one of rejoicing to all the citizens, for they saw in it the dawning of a new era in the fortunes of Alpine. Some two hundred, many of whom were ladies, were present. The mill will be completed by the first of October.

Same paper of 25th says: Work is progressing rapidly upon the Washington mill and mine. The ore is improving. On the day of the "dedication," a specimen was exhibited which was valued at \$300 per ton, and was taken from the main lode where the pyrite is four feet in thickness, and uniform in quality.

The *Alpine Miner* has the following: The contractors, Kustel & Uznay, have two men at work, assorting ore at the Morning Star mine, to be hauled to the mill at Davidson's as soon as the platform is ready to receive it. . . . The Mowyer tunnel goes on slowly, the rock being hard. It is now in 150 feet. . . . The American T. & S. M. company now have about 140 feet of tunnel leading from the main shaft, drained by their water-wheel. If the Kustel & Uznay works prove a success—which few doubt—the American will soon erect similar furnaces with mill of fifty tons capacity.

Amador County—

The following items are from the *Ledger* of August 25th: Messrs. J. L. Ripley and Albert E. Crane have purchased from the locators seven thousand feet of mining ground lying east of Hunt's Gulch, between Scottsville and the Mokelumne river. They have a number of men at work sinking shafts, etc., and will thoroughly prospect their ground. . . . A recent crushing of 170 tons of ore from the Grande Vista made an average yield of about fourteen dollars to the ton. . . . The Kelly & Stevenson made a clean up yesterday. The result is said to have been entirely satisfactory, though we have not learned the amount per ton. . . . The Anaconda is once more under way, with fine prospects ahead. . . . The Excelsior did not pay. Some forty tons of ore, worked at the Fogus mill, yielded about four and a half dollars per ton. The probabilities are that by going deeper better rock will be found. . . . The Tellurium has temporarily suspended to prepare for sinking deeper. . . . The Golden Eagle (Vaughn & Co.) are still getting rich rock, which is being crushed at the Tellurium mill. . . . The Iron Bound (Sorocco & Co.) is now down to a depth of about 200 feet. The rock looks well and will soon be tested.

Butte County—

The *Record* of the 25th August says: Messrs. Louis McLane, A. F. Williams, and other gentlemen from San Francisco, visited this placer mining locality on Thursday, with a view of ascertaining the probability of its affording a profit upon the cost of constructing an expensive canal to supply it with water for mining purposes.

Calaveras County—

The Copperopolis *Courier* of August 25th gives these items: A very rich strike was made yesterday in the Gold Hunter mine, situated in Salt Spring valley, which, from present appearances, is likely to prove the "biggest thing" in the country. Specimens of the quartz were brought to town, which showed about one-quarter pure gold. . . . The Antelope copper claim is being rapidly developed. We learn from a gentleman interested that during the past week they have found a vein which prospects satisfactorily. . . . We are informed, says the *Register*, that the quartz claim of Woods & Co., situated about six miles west of Murphy's, is paying exceedingly well. They have a vein about a foot or eighteen inches wide, the rock from which pays, when crushed in an arastra, from \$150 to \$200 a ton. Two tons of the rock crushed last week yielded \$338.

Fresno County—

The Mariposa *Free Press* of 18th August says: Five teams were loaded at the Buchanan copper mines during the past week, with ore for shipment via Stockton. The amount transported was 86,000 pounds. The water is now at too low a stage for shipment by the Upper San Joaquin route. . . . Owens, Moore & Coghill, of Stockton, have purchased the in-

terest of N. Haskell in the Buchanan Vein and smelting works for \$22,000.

Kern County—

The *Alta* of August 24th gives the following from a correspondent:—I have thought it would not be amiss to give your readers a history of the mills running in the Clear Creek District, discovered two years ago: The Delphi Co.'s mill, 10 stamps; Piper's, 12; Gen. Grant, 10; Kalluna Wright, 5; Bigler Co., 10; Clarkson, 8; Rand & Co., 10; Marsh & Co., 6—a total of 72 stamps, all of which are running on good paying ore that yields \$20 per ton. We have plenty of wood and water. We crush ores by the ton, not by the load as in Grass Valley; and, when properly adjusted, I hazard nothing in saying that our yield is larger per ton than in Grass Valley. These are facts, and I wish to call the attention of capitalists to them. We have in course of construction in our immediate neighborhood three 20-stamp mills, that will be in motion in the next thirty days, with plenty of ore out to keep them running. There are also the Mammoth Co., 20 stamps; the Jo. Walker Co., 20 stamps, and the Eldridge & White Co., 20 stamps. Twelve months ago we had one 5-stamp mill only in the District.

Klamath County—

The Humboldt Bay *Journal* of Aug. 16th says:—Two and a half tons of copper ore arrived here on last Sunday from the Capparum District, in Klamath county. This ore is from the "Red Cap" claim, and is very rich. The owners of the claim intend sending it to San Francisco to have its value tested, and as a sample of their mine. We predict that the whole two and a half tons will yield over fifty per cent. pure copper. Those interested say they have struck a regular and well-defined lead of this ore.

Los Angeles County—

The *News* says: The Rochester mine is located in the most western portion of San Bernardino county, Slate Range district, about one hundred and fifty miles from Los Angeles. This mine has been in product for nearly four years, and above 5,500 tons have been reduced, at an average of \$16 per ton. It was sold subsequently at Sheriff's sale; but late returns show the mine to be very rich.

Nevada County—

The *Gazette* has these items: The owners of the U. S. Grant ledge have lately had fourteen tons of rock crushed at the mill of Perseus & Co., near Carlisle, which yielded forty-one ounces of bullion valued at \$732.28, being at the rate of \$52.30 a ton. . . . We learn that the quartz mill now in course of construction on John Young's ledge, near Eureka, is rapidly approaching completion. The machinery and other materials are all on the ground, and it is expected that the mill will be started up early next month. The mill is being erected by R. C. Black, for an interest in the ledge. . . . We have been shown some fine specimens of sulphuret ore from the bottom of the incline of the Banner mine, at a depth of about one hundred and eighty feet from the surface.

We clip from the *National*: Forty-two tons of rock from the Ben Franklin mine have just been crushed at the Sebastopol mill. The company are down but a short distance on their ledge, yet the rock taken out yielded thirty-five dollars to the ton. . . . A 400 foot shaft is to be sunk on the Daisy Hill mine. It is already commenced and is to be eleven by four and a-half feet in the clear. . . . Capt. Kidd has lately sold an interest of five-twelfths in one of his quartz claims for the sum of \$62,500.

The *Union* says the Washington ledge, or Jefferson Hill, about three and a-half miles from Grass Valley, on the Crandall grade, was struck on Thursday last. Work has been energetically pushed in driving a tunnel for this ledge since April last, and at a distance of about 248 feet from the mouth of the tunnel the vein was struck.

EXCELSIOR.—The Meadow Lake *Sun* says: The owners of the Enterprise mine, five miles from Meadow Lake, are sending ore to Winton's mill, to see how that mill will succeed in saving the gold. We judge from this that the managers of the mill erected at the mine have not yet succeeded in working the ore satisfactorily. . . . Excelsior Company have struck uncommonly rich ores in their mine. Some of the owners think it will work as high as \$1,000 a ton. How much of that kind of ore they have found is not stated. . . . Bullion shipments from this place during the present month are as follows: The 22d inst., Mountain Chief, \$188; same date, Mohawk and Montreal, \$833.60; 24th, U. S. Grant, \$827.12; same date, Gold Run Phoenix, \$698. In addition to the above, on Friday, there was received from the Grant a bar of \$732.28 for shipment.

We condense the following from the Mendocino Lake correspondence of the *Alta*: Not until the exodus of the laboring population, and until a stagnation of business prevailed, did the people realize their fatal mistake in overlooking the true source of their prosperity

and wealth—the mines. To this is attributable the unfavorable reports circulated abroad. It is a source of congratulation, however, that the people are beginning to realize that, although the possessors of valuable mines, they will remain in poverty until the same are made productive.

Placer County—

The *Herald* has these items: The Peter Waller claim is again turning out gold in abundance. Last week Mr. Waller took out several hundred dollars. In the language of a friend, who was at the claim, it looks "lousy." The vein is about twenty inches wide. . . . The Davenport company located their claim on Wednesday last. It is situated on the west branch of Baltimore Ravine. The location is for 2,600 feet. The rock looks well. . . . The Red Ravine ledge is located near Pino, and is owned by Messrs. McWade & Hartley. The owners are now erecting a 5-stamp mill to be run by a turbine wheel. They expect to be crushing quartz in about three weeks.

The following are from the *Stars and Stripes* of 22d August: Some splendid rock has been taken from the Civil Right's mine at the depth of 129 feet, the ledge being 22 inches wide. The owners will send all the rock they have out—some 50 or 60 tons—to Welly's mill to be crushed. . . . Messrs. Millette & Harvey have started up the mill on their ledge in Baltimore Ravine. . . . On Sunday last, a boy of from twelve to fourteen years of age, while crossing a quartz ledge which crops out about two feet wide, noticed gold in the rock, and on further examination it was found that there was a streak about two or two and-a-half inches wide in the center of the ledge nearly half gold. Three thousand feet on the ledge were speedily located and recorded in the name of the "Suffrage Company," who propose to go to work immediately.

It is said that Messrs. Treadwell, Harpending & Co., owners of the noted Banker mine (formerly known as the Baker & Crosby mine) at Whisky Diggings in this county, have effected a sale of one-half of the property to San Francisco capitalists for \$175,000—a high figure, but the mine is worth it. The new company intend to erect immediately a 20-stamp mill, and go to work in earnest. The mineral vein is about 100 feet in width, and the ore, which yields from \$7 to \$15 per ton, is worked with astonishing ease and rapidity.

Plumas County—

The *National* of 25th August, has the following from Nelson Point: Messrs. Murken & Shubert are working their claims, on Nelson creek, with a greatly improved water derriek.

Letter to same from Mineral township says: Mr. Wm. Jacks has been cleaning bed rock for the last two months, and doing well. Esq. Jacks, for last week's work averaged \$8 per day to the hand. Esq. Metcalf, on Gopher Hill, is still tunneling in his old claims, to get back to the inside channel, where the gold is coarse. Simpson, Acres & Co., in the creek at New Boston, are doing remarkably well. The Portuguese are making wages, and content to do so, having plenty of four-dollar ground to work for the next ten years. Calhoun & Co. are doing the big thing on Brandy Flat. Sam. Carr, at Meadow Valley diggings is still prosecuting his claim, with big expectations, from the good prospects he has in the gravel. John Tucker, Robinson, Wilson, and others, of Eagle Gulch, are all doing well. Mr. Brown, at the Cold Spring Retreat, near Spanish Ranch, has struck a side channel of gravel, which prospects well. Canada Paul and Major Brown, on Meadow Valley creek, are doing well—remarkably so.

Shasta County—

The *Courier* of 25th, has these items: South Fork prospects are very encouraging at present. Rock found in the shaft of the Chicago has proved to be extraordinarily rich in silver, with quite a respectable sprinkling of gold. Parties in San Francisco and Sacramento having become interested in the mine located by H. M. Peck, have commenced the work of development in earnest. . . . On Wednesday the Mammoth company ran a couple of tons of rock from the Harrison lode through their mill, and cleaned up thirty-six ounces of amalgam as the result. This amalgam will probably assay as high as five dollars per ounce, which will amount to \$180 for the two tons. . . . The Tornado company have just completed a new flume for the purpose of conveying water from the Clear Creek ditch to the hill back of Middletown, where they have located a claim of 3,600 feet. . . . Parties just in from Copper City report no new indication of striking the ledge in the Kellinger tunnel. The rock is quite hard at present, but the water which lately flooded the tunnel is subsiding. Capt. Stoffard has discovered new and very rich, but not extensive, placer diggings, in Horse creek. The gold is coarse, and found in "pot holes" in the bed rock.

Sierra County—

We clip the following items from the *Messenger* of August 25th: The American Hill mill is paying steadily and well. . . . In opening the Old Oro claims, the workmen have

struck a new vein, heretofore untouched, that it is estimated will pay \$30 per ton. We shall soon want more mills for working out rock. . . . Giles H. Gray, of the Gold Valley quartz mills, called on us a few days since, and reported progress. He informs us that the mill is in capital order, and that the prospects are very flattering.

Editorial column of same has the following: New and rich discoveries are daily reported; the older discoveries and developed property growing richer in depth, and yielding larger monthly returns, which has given a decided impetus to business.

The *Advocate* of the 18th has these items: The Independence, at Sierra Buttes, and the Keystone on the other side of the river, are running on rich rock. . . . The Primrose Mill is getting ready to start up in a few days. Their metal house is very full of very fine ore. . . . Gold Valley mill will start up in a few days, and is prepared to test the new Varney process on their sulphureted ores. They have several tons of rock in their metal house, of which a workingtest gives an average of \$30 per ton. Havens & Limpricht are commencing work at Gold Lake. . . . Speneer & Gray, at Gold Valley, will start their mill in a few days on rich rock. . . . The Gold Bluff is driving their level ahead rapidly. Montpelier company have their level in bard rock, but are progressing. . . . The Sailor company are taking out ore, and opening their vein preparatory to regular workings. . . . The Good Hope company have been testing their rock at the Moutpelier mill, and cleaned up a few days since. The ore tested were an average of the vein and yielded twenty dollars per ton. . . . In Ladies' Cañon, Anderson Co.'s claims are paying richer than ever before. We understand \$4,500 has been offered for an interest.

Editorial of same is highly jubilant over the prospects of Sierra.

Siskiyou County—

The Yreka *Union* of 25th Aug. says: In Humboldt, the claim of Messrs. McKimney & Miller, three miles above the Forks, has averaged about \$40 per day since the first of April. Messrs. Shepp & Jones intend erecting an arastra soon near the Forks for the purpose of prospecting quartz. Messrs. Lash & Co., are taking out some good rock. . . . Some new placer diggings have been recently discovered on South Fork, and it is believed that they are quite extensive. . . . The Scholes lead cleaned up, after a five day's run, last week, \$400, and it is supposed at least one-third of the gold was lost.

NEVADA.

Washoe—

The *Territorial Enterprise* of August 20th says: On Thursday afternoon some very rich streaks of ore were encountered in the Gould & Curry mine. It was found in sinking an incline from the second to the third levels of the mine in order to create a better circulation of air, and is about 500 feet southwest from the Bonner shaft, and over four hundred feet below the level of D street. We saw several sacks of the ore at the Bonner shaft house yesterday. It is very fine—more like sand than rock—and will probably yield between two and three hundred dollars to the ton. The extent of this ore is not yet known, but there are flattering indications of the existence of a good body of it below.

The Keystone mill has produced bullion of the value of \$20,000 during the last fourteen days. . . . The rich streak of ore found a few days ago in the Gould & Curry mine still continues to hold out. An assay of some of the average of this ore, made a day or two since, yielded \$485.44 to the pan.—*Alta*, Aug. 25.

Reese River—

From the *Reveille* we clip the following items: Edward Gilman shows us a specimen of ore from two ledges in Hot Creek district. The ledges are called the American Hunter and Silver Glance; and they are situated about half a mile south of the Indian Hunter and Old Dominion. The assays of the mineral show: first class, \$955.08 of silver per ton; second class, \$293.48; third class, from the surface, \$57.07. Some three tons of ore, from the El Dorado and Buel's location on the High Bridge, in the Philadelphia district, arrived in town on Saturday for reduction at one of our mills. . . . We were shown this morning an assay of mineral from the Orient ledge in the recently-discovered Reveille district, which shows as follows: silver, \$113.09; gold, 30.01; total, \$143.10 per ton. . . . In Smoky Valley district the tunnel of the Commercial Silver Mining company is seven feet high and six and a half feet wide, and its extreme length will be about 350 feet. Work is being prospected night and day. The Big Smoky company's claim upon the same ledge has been perforated by a tunnel 340 feet long, at which point they cut the vein, and they are now preparing to extract ore.

The principal ledges of Danville district are the Vanderbilt, Silveropolis, Maid of Erin, Moudnock, Green Monster, and Hibernia. Specimens of their ores have been assayed with the following result: Vanderbilt, first

class, \$1,702.82; second class, \$895.89; Silveropolis, \$387.50; Maid of Erin, \$486.97; Monarduck, \$207.15; Green Monster, \$103.67; Hibernia, first class, \$3,560.87; second class, \$1,197. The Vanderbilt is twelve feet wide.

Hot Creek district seems to be one of the most promising of all. The *Reveille's* "Notes of a Prospector," says: The Old Dominion ledge is from ten to fifteen feet in width. It contains a large quantity of horn silver—more than any vein that I ever saw. Take up almost any piece of rock from it, break it where you may, and you will detect its presence. Fifty thousand dollars have been offered for this claim, but the owners refused to sell. . . . The Gazelle is another very fine looking vein. A small opening has been made upon it, and a fine body of ore discovered, assaying upwards of one thousand dollars per ton. This ledge is situated about one mile and a half south of the Old Dominion. . . . The Silver Glance ledge is situated near the summit of a high mountain, between Old Dominion and Rattlesnake canons, and is a recent discovery. In breaking off pieces from the croppings on the surface, metallic silver could be seen, and rich sulphurets permeated the veinstone. . . . Near the Silver Glance lies a huge ledge called the American Hunter. Like the Gazelle, the ore is a rich black sulphuret, in which is to be seen a profuse sprinkling of metallic silver.

A letter from Mountain View Spring, Hot Creek, dated August 16th, says: "The more I see of this country, the stronger becomes my conviction that in a very short time it will excel any other known mining region for the abundance, size and richness of its silver-bearing ledges. Almost every day something new and rich, in the way of locations, are made. The district furnishes an abundance of wood and water."

The *Nye county News* of August 18th says: We learn that several tests of ore have been made by Jones' 3-stamp mill, in Mammoth district, with an average result of seventy dollars per ton. A lot of seven hundred pounds of ore from the Vigilante ledge was worked last week, and yielded at the rate of \$111.70 per ton. Letter to same from Mammoth district gives these items: The Mount Vernon company have a tunnel in 240 feet, and a shaft down eighty feet. Four hundred feet from the mouth of the tunnel, near the shaft, a vein has been tapped some eight or nine feet in width, showing ruby and sulphuret ore in abundance. . . . The Frankfurt and Alta are large and well cased ledges, showing chlorides and sulphurets in paying quantity at the surface. . . . The Vincennes and Rocky Mountain are large ledges, and contain rich rock. The letter says: "If Mammoth is not the No. 1 mining district in less than three years, many who have visited the district will be disappointed."

Correspondence of same paper says: Col. Bael's mill in Belmont, Silver Bend district, will be running in ten or fifteen days. . . . When we arrived at the High Bridge ledge, we were struck with wonder and surprise at its extent and apparent richness. The ledge is over twenty feet between casings, solid quartz, and all pay ore. I think \$200 per ton would be a low estimate on the entire ledge. . . . Same says in regard to Hot Creek: "There is no district in the State that can show as many large ledges and as much rich ore. I visited some twenty or thirty locations, and without a single exception they show good ore on the surface, and are large, ranging from twelve to fifty feet in width."

Same paper of 20th has the following: The Knickerbocker mill only shipped 1,204.73 ounces of bullion by stage on Thursday last. By the breakage of some of the pan gearing they were compelled to stop for a short time, but are all right now, and will soon be turning out as much bullion as ever.

Editorial of *Reveille* says: "If we had reason six months ago for asserting the superior richness and prepossessing advantages of our State, with what vastly increased confidence and assurance can we assert it now. Rich as our section was known to be then, the extent and grandeur of the discoveries of the past summer have far exceeded what was previously brought to light, and added many 'Reese Rivers' to the Reese River of the past. The success of the prospectors who have gone forth from this city during the past year has never been surpassed, even in the days of '49 in California, or in the occasionally rich gulches of Montana."

ESMERALDA—

The *Union* of August 25th speaks of several mines in California which pay well for working, although yielding only from six to ten dollars per ton, and adds: If the day soon comes when quartz can be worked at a profit in Aurora for fifteen dollars per ton, we need not despair of seeing good times again, for there are very many fair sized ledges in this district which will yield more than that amount. There is a large quartz vein in the Discovery tunnel, owned by the Philadelphia company (and there are dozens of others like it in all parts of the district), which would be worth an immense fortune if it was situated on the other side of the mountains, but it will not pay here

at present because the cost of reduction is too great.

Same paper of 18th says: "John D. Winters, of Gold Hill, has purchased the Junata claim, situated on Martinez Hill, and intends to put a large force of miners to work on it immediately. His mill is being repaired with all possible dispatch, and will be in readiness for crushing the ore by the time the miners get fairly to work."

A correspondent of the *Sacramento Union*, writing from Aurora, August 19th, says: Very many ledges have been located and relocated under the new State law. Eight men are working the Crockett and taking out good rock. The Utah, Durand, Locomotive, Olive Branch, and Jack Hays are being worked with favorable prospects. . . . The Golden Age and Empire company's shaft is down 300 feet. They have, on account of water, stopped until they get an engine. Prospect favorable. . . . The Empire mill, at Bodie, is crushing rich rock from the lower level of the mine. . . . The last crushing from the Homestake ledge yielded \$160 to the ton.

BUMBLDIT—

The *Register* of August 18th gives these items: Chas. Balbach has sold his interest in the Montezuma mine, 175 feet, to A. W. Nason, for \$7,500 in coin. Balbach will leave for the East in a few days. . . . In Buena Vista district work is going ahead in most of the old ledges. Manitowoc, Chameleon, North Star, Arizona, Seminole and others, driving ahead. Several other companies are organizing, and will commence soon to develop their ledges. . . . Work was resumed in the Rochester company's claim, on the Montana ledge, under direction of Superintendent Lark. Work will continue day and night till the ledge is struck. Double shaft down 136 feet. . . . Pioneer mill has been running this week on ore from the Manitowoc ledge. Average yield about \$100 per ton.

The ore now being crushed at the Sheba mill yields seventy-five to eighty dollars per ton. They work 2½ tons per day. Some 500 pounds of slag, worth about three dollars per pound, was shipped to Virginia, by Moyer's express, for melting there. . . . The mill is soon to be changed for wet crushing, and if custom work is supplied, will be run all winter. For the last two weeks they have been burning sage brush, for generating steam.

ARIZONA.

The *Miner* of June 27th, has the following: The Yuma mining company, is about to begin operations. The plan is to work the placers about Gila City (which attracted attention several years since) upon a large scale. . . . The Strawberry lode, on the Hassayampa, near the Chase mine, discovered by the Messrs. Boggs, and others, is the town talk. Assays of the ore have given a yield of \$2,600 to the ton in silver.

A letter from Mohave City give the following items: "The Moss mine and Hardy mine are getting along after the old fashion—no perceptible change. The mill of the former will be erected during the summer at Hardy's Landing. The Mohave Chief, in Sacramento district, is thriving beyond expectation. The Leland, in San Francisco district, is now turning out some very fine rock."

Same paper of July 11th, says: The Sterling mill is in active operation, and works to a charm. . . . The White mountains are likely to be well explored this season. Besides the Swilling party, the one from Santa Fe and that from San Francisco, one has just started from Prescott.

From same of July 25th, we clip these items: The sale of Territorial mining claims on the 20th was well attended, but there was not much interest except in the Sterling and Umpqua claims. The former was bought by Dr. Newhall for \$150, and the latter by W. N. Kelley, for \$175. Both have been jumped, but we hear that the parties in possession of the Umpqua have made a satisfactory settlement with Mr. Kelley. The Sterling claim will probably be litigated, and made a test of the validity of the Territorial law, which is questioned by some. . . . A. O. Noyes and Geo. Curtis have agreed to put a mill upon the Umpqua lode, and the former will start tomorrow to San Francisco to procure it. . . . Hon. Robert W. Groon has returned from Fort Yuma, having made arrangements with Captain Johnson for a 5-stamp mill, which will soon be here, and probably be put upon the Sterling lode. . . . Capt. Coffin will have charge of the Vickroy mill, parts of which are now at the Bully Bueno lode, and at Woolsey's ranch. The mill will, we are glad to say, soon be put in operation, but probably upon some other lode than the Bully Bueno, which is said to have turned to silver.

Letter to same from William's Fork, June 20th, says: Coffin & Co., from New York, have commenced operations on the ledge near Mineral Hill called the Adelphi, and although they have been at work but a short time, they have succeeded in taking out considerable ore of a very good quality, and are confident they have a good mine. They are shipping their

metal to San Francisco to have it tested. . . . Messrs. Ripley & Crane, also of New York, have arrived, and purchased two extensions on the Eliza and one on the Ashley, and are making the necessary preparations for operating on the same. . . . Martin & Co are now receiving machinery from California for the purpose of placing reduction works upon the Mineral Hill mines, and have contracted for the burning of 26,000 bushels of charcoal. Mr. Thompson has not got his smelting works in operation, owing to some part of his machinery being left behind on the river. It is the intention of the Phant company to push the work ahead as vigorously as possible. The ore taken from this mine yields about 47 per cent. There has also been taken from the mine thirty-seven tons of wash ore, which yielded 61 per cent, and sold for \$240 per ton in San Francisco.

Colorado papers say that a large exploration party is to start from Santa Fe, about the end of the month, to prospect the Gila River country.

The *Alta's* Prescott correspondent, to date of July 23d, gives these items: The Woolsey Water mill, on the Agua Frio, twenty-five miles east from here, is running five stamps. The ore is from the Central and Ticonderoga lodes, distant some five miles from the mill, and thus far it has returned from \$50 to \$100 per ton. The lodes are very large, and there would seem to be no end to the ore. The Sterling mill, five stamps, upon the Sterling lode, five miles south of Prescott, has been running for two weeks past, and is said to work finely. The ore has thus far paid from thirty to fifty dollars per ton. The lodes on Lynx Creek, ten miles east from here, and one of the richest districts, all show sulphurets, and most of them at a depth of fifty feet indicate a change to silver. The Eureka, one of the most noted mines, shows a greyish black rock at sixty feet. Mr. Cummings, one of the proprietors, will go to San Francisco in a few days with some hundreds of pounds, in order to secure a thorough test, and learn the exact process requisite to its successful working.

Mr. Lamson's two Thunderbolt mills are here. One will be in operation on Lynx Creek early in August, and, if necessary, arrangements will be made for working silver as well as gold quartz. At forty feet the shaft on the Florence lode, near the mill, and the ore from which Mr. Lamson proposed to work, shows silver rock—a six-foot vein—some of it fit to compare with that of Washoe.

The Borger mill, in which Wormser & Co. are interested, is rapidly approaching completion, and ores from the Big Bug and Galena lodes, in the Big Bug district, are ready for it.

IDAHO.

A gentleman lately returned from Owyhee, says the *Flag* of August 28th, says the New York and Owyhee mill is running on Poorman rock; the Grenzabach on the same; Moore & Fugus on Oro Fino; Wass, on custom rock; Lincoln on Oro Fino; Cosmos on Silver Legion; Minear on Oro Fino, and the Ainsworth on Surplus Oro Fino. The Webfoot and Schonbar is not running. The others all run day and night. . . . The Lincoln mill of twenty stamps, crushed one hundred tons of Empire rock in a single day. . . . Moore & Fugus have a mill on the way to Flint district. . . . Richards and McAlpin have purchased the South Extension of the Morning Star. . . . The Trook & Jennings has been bonded to the same parties for \$130,000, and work on it is progressing. . . . Everything is lively in the Owyhee country.

MONTANA.

From the *Post* of August 11th we clip these items: We learn from a gentleman just in from Wigwam Gulch, that there are eight men at work on the bed rock drain ditch in that gulch, and from the prospects found so far, they will, when the ground is opened properly, have a "big thing." The dirt prospects lately from the top. . . . The quartz mill formerly owned by the Seneca Falls Mining company has been purchased by Mr. J. P. Isaacs, agent for a heavy firm in New York. The mill has fifteen stamps, with capacity for forty. The institution is located in the vicinity of Kearsarge Gold and Silver bearing quartz lode in Summit district. . . . In Bannack both coal and fine clay have been discovered. . . . Messrs. Bledsoe & Comstock have recently discovered what they think to be a tin lode a short distance from this place, in the direction of the Stinking water. The rock which they obtained from a shaft on the vein is found to contain no mineral but tin. . . . Captain Malthy has discovered a lode in Hot Spring District, which is pronounced by old Cornish miners to have every indication of being a first-class tin lode. . . . During the week fifteen quartz lodes have been recorded in the county Recorder's books. Four of these lodes are located in the Silver Star District, and the remaining eleven in Summit, Nevada, and Junction districts. The discoveries in Summit are said to be very good.

COLORADO.

The *Journal* of August 7th, has these items: Every day witnesses the return of some of the Bear River prospectors. . . . Mr. Cyrus Hurd has just returned from Red Mountain, and be

says "if there is any gold in the ore it is the biggest thing in the world." The Broadway company ran 100 pounds through a Bertola Pan in the fall of 1864, getting \$4.77 or at the rate of \$95.40 a ton. Seven hundred pounds was brought over the other day by a Denver company to be tested. . . . Col. Baxter has a little barrel amalgamator for silver ores at the Dodge mill in Eureka. The other day he put through forty-six pounds of Argentine ores, and retorted twelve ounces of pure silver, at the rate of 500 ounces of silver, or \$675, coin value, per ton.

Same paper of 14th, says: We learned yesterday that the Bobtail company, the Sterling, Black Hawk, and Brastow companies, and Mr. Field, and Mr. Sencsunderer, all owning together about 767 feet on the Bobtail lode, had at last concluded to go on and put in the 6-inch pump for the use of the entire lode, purchased for that purpose some time ago by the Black Hawk company. . . . We took a look through the Manhattan mill in this place, yesterday. There has been a complete alteration since we were last in it. The stamp batteries and Dodge pans have been taken out and thrown aside, and the C. & T. desulphurizer reposes in neglect. A handsome Keith furnace has been built, stack and all, a large Ingersoll Crusher, which takes the ore wet or dry equally well, set up, new lines of shuffling put in place, and twelve shaking tables made. A complete Keith "outfit" has been nearly perfected. The Colonel expects to be able to start by the 1st of September and to run two cords a day.

The Susquehanna Company are taking out fine looking ore on the German. . . . Jno. Shumer is opening a new lode called "The Hammond," in Spring Gulch. At 20 feet from the surface he has 12 inches of pure ore, worth \$450 a cord by Keith process. DuBoise is going to start his new Keith mill on it. . . . A new lode just below the Fiske is being opened. The shaft has reached a depth of seventy feet, and the crevice of gossan, prospecting very largely, is from three to four feet in width. . . . Mr. Pritchard is opening a lode on the point of Quartz Hill, running down into Spring Gulch, called "The Whalin." He has acquired 2,200 feet of the vein, and has a three to four foot crevice of forty feet from the surface. . . . Mr. Hale is driving an adit to intersect a shaft on the "Elua," eighty feet from the surface. He has, both in the shaft and adit, from three to four feet of ore, iron and copper pyrites and galena.

The *Register* says that the Niwot Company, running twenty-five stamps in Ward District on Columbia ore, are taking out \$280 a day. Mr. Maynard has leased Col. Ford's furnace, head of Russell, for the purpose of smelting the Sierra Madre Company's ores.

From the *Denver News* of Aug. 15th, we clip the following:—A new district, called the Central, promises to be very rich. Most of the lodes yet discovered are situated on James Creek, a small tributary of St. Vrain, and about twelve miles above William's Saw Mill. . . . An assay was made in Black Hawk from a specimen of argenteriferous galena from the Buckhorn lode, which gave a return of seventy-five dollars to the ton in silver, and twenty-five dollars in gold.

Prof. Hermann, of Vivian & Co.'s Smelting Works, Swansea, writes from Central City to Jas. F. Lyon, New York, as follows:—Yesterday I visited, with Mr. Hayes and my friend, Professor Hill, the Consolidated Gregory Mine, and can but join in the judgment generally expressed throughout the Territory on all sides, that this is the very best managed, and no doubt one of the richest mines. The working resembles in every way so closely the European plan of mining, that I could almost have fancied myself down in one of the very best Cornish shafts, with the difference that the value of their produce does not bear to be mentioned side-by-side with that of your ores, which carry such considerable percentages of the three most valuable metals known. From the several interviews which I had with you in New York, you are without doubt impressed with the fact that I look upon smelting operations as the only practicable solution of all the difficulties met with out here.

A letter to the *Denver News* from Silveropolis, dated Aug. 7, says:—Prospecting and development still goes on in this region. Joe Boyd is sinking on the Elephant and Emperor, and taking out rich looking sulphurets.

John Reno is running a cut on the bank, preparatory to sinking on the Anglo Norman. Reno and Boyd have made several valuable discoveries this spring.

Messrs. Haak & Cresson have made some good discoveries. Jack Lynch is putting up his furnace as fast as men and money can do it. The silver mines of Summit county will be the saving clause for Colorado.

Another dated August 14th, says:—Mr. A. A. Sawyer, the agent of Whitney & Whiting, is at work on the "Ten Mile" with a gang of thirty hands. He informs me that the ore from all the lodes, about sixty, they are working, looks better the deeper they go.

Mining and Scientific Press.

W. B. EWER,..... SENIOR EDITOR.

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. Thomas Starr is Agent for the MINING AND SCIENTIFIC PRESS in Nevada, and will canvass the principal cities, towns and districts of that State. August 25, 1866.

Mr. O. P. Truendell will act as our Corresponding Agent and Solicitor in the interior of this State, from this date. August 25, 1866.

Mr. E. F. Dewey is duly authorized to receive subscriptions and advertising, and transact business for this office. August 18, 1866.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. San Francisco, Jan 11th, 1866.

Mr. I. N. Hudson, is authorized to solicit subscriptions, advertising, etc., for the MINING AND SCIENTIFIC PRESS, in San Francisco, and to receipt for the same.

San Francisco:

Saturday Morning, Sep. 1, 1866.

THE STATE AGRICULTURAL FAIR will open in Sacramento one week from next Monday. Would it not be well for those of our citizens who propose to exhibit at the Paris Exhibition, to present their articles previously at the State Fair. It will cost nothing to send them, as all freight to the State Fair goes free on the Navigation Company's steamers. Would not such a course pay in the general interest it would excite in stirring up a greater number of exhibitors at Paris? We think it would, and should be happy to announce in our next issue that a general movement has been inaugurated in this direction. Have our mechanics and others completed their arrangements to be represented at Sacramento? We should be extremely sorry to be called upon to report that the mechanical and other products of this city did not occupy the proportion of space and attention which their importance and merits demand. If such should be the case, it will not be the fault of the management of the Society; for the most ample arrangements have been made and free transport secured for the benefit of exhibitors. It is not even yet too late to make arrangements to exhibit at Sacramento.

AGRICULTURAL AND MINING ART COLLEGE. Several counties in the central portion of the State are making efforts to secure for their respective localities the location of the Mining Art College, an institution which must soon become a reality. The Commissioners, upon whom will devolve the location of the College, invite proposals from the several counties, as to how much they will do, pecuniarily, toward its establishment. Both the amount which may be raised and the natural advantages which the various competing localities can present, will be taken into account in making the decision. Sacramento and other towns and cities, are taking active steps in the matter. Has San Francisco no aspirations in that direction? Would it not be well for some of our enterprising and moneyed men to think of the matter? Fifty thousand dollars ought to be easily raised in this city for securing the location of the principal college building here, with a model farm near Oakland. The advantages of such a location, when taken into account the importance which this city must always afford over any other place in the State for scientific advantages and appliances, must be apparent to every intelligent person.

A NEW PAPER MILL, for the manufacture of wrapping and other coarse papers, will be immediately erected near the old Blackburn sawmill, on Branciforte creek, about three miles northeasterly from Vera Cruz. The enterprise is set on foot by San Francisco capitalists. Thus gradually is capital seeking for some investment, a process which will continue, until our already large and growing home market is supplied with everything which can be produced on the Pacific coast.

THE USE OF THE SYPHON IN MINES.

We are not aware that the syphon has ever been satisfactorily introduced for relieving mines from water. We have heard of several attempts having been made; but so far as our recollection goes, the experiments have proved failures, for what reasons, however, we have never learned until in the case instanced below. That they might be thus made serviceable may be reasonably inferred from the fact that they have been successfully employed in some parts of Europe for removing the water of dry docks. The following was addressed to us as a private letter; but it is of so much general importance and interest to miners, that we have taken the liberty to publish it in full, hoping that it may bring out some valuable experience or suggestions from others, in addition to such comments as we may make. The letter is dated "You Bet, Nevada County, August 22, 1866."

EDITORS MINING AND SCIENTIFIC PRESS:—I take the liberty of writing to you, with the hope that you can give me some information in regard to the theory and practical working of syphons, as I am not very well posted in regard to how a syphon can be put in working order. Knowing you to be informed in such matters, I apply to you for the necessary information.

A syphon was recently put into the claims of Messrs Neece & West, of this place. It consists of a lead pipe two inches in diameter, 500 feet in length, soldered together in five sections, of 100 feet each. The joints are substantially made and perfectly air-tight, and with a stop-cock at each end to gauge the water. There is also a funnel and stock-cock soldered to the spring of the arch, for the purpose of filling it with water. The tube of this funnel is one-half inch in diameter, and two inches long. In laying the pipe, we did not take much pains to have it straight. The arm that leads to the well or pool of water in the mine, is bent short, say in a seven-inch circle. The tunnel sets rather toward the discharge arm. From the arch, the first hundred feet has a fall of about one quarter of an inch to the foot; the next hundred feet has all of six inches to the foot. At this point the pipe strikes the bed-rock and continues to rise and fall for the next hundred feet. These flexures rise and fall at about an average of one foot to every twenty. I have thought that perhaps it might be those flexures which prevent the syphon from working. The last section, which is nearly straight, has a good fall for one hundred feet. At twenty feet from the discharge it turns down rather abruptly into a shaft.

I append the following rough diagram, which may possibly aid you in forming a more distinct idea of the arrangement. In the diagram, A represents the bottom of the well, or "sump," which collects the water of the mine, and from which it has heretofore been pumped; B represents the funnel, with stop-cock fixed upon the spring of the arch; C represents the discharge. The different grades of fall and flexures, or the rise and fall, will be readily apparent to the eye.

To filling the syphon we had some trouble; could not fill it by pumping water into the funnel of the arch, as the pressure of air seemed to interfere with that mode of filling. We had to construct a temporary suction pump, and attach it to the discharge end. In that way we got the syphon started, and it ran very well for seven hours, then gradually stopped. [Our correspondent does not inform us how often this was repeated.] The bottom of the discharge arm is sixteen feet lower than the level of the well in the mine. I send you a drawing of the syphon in this letter, and would like to have you give such information as will correct the errors which we have made. By so doing, you will confer a great favor on the writer, and probably many others who may have attempted or would like to introduce a syphon into their mines. Please allow me to ask the following questions:

1st. In laying down a syphon, is it necessary to have a gradual incline from the curve of the arch to the discharge arm?

2d. Do those flexures or sags interrupt its perfect working?

3d. Does the water, running slowly through the pipe, leave air behind it?

4th. Does water accumulate in those sags?
5th. Is the pressure of the atmosphere different in the tunnel, from what it is in the open air?

6th. What grade is necessary to make a syphon of that capacity work proper?

7th. What is the best means to start it when it stops discharging?

8th. How long ought a syphon to run without stopping, under such circumstances?

Yours truly, J. G.

The principle of the syphon is too well understood to need any explanation. We will assume that in the present case it has been made perfectly air-tight, as stated. Our correspondent supposes that the turns and flexures of the tube may interfere with its action. They will do so in a degree, only in proportion as they cause an increased friction of the water. With regard to the admission of air, they will make no difference if the gauge cocks are properly set to regulate the flow. We will answer the queries by numbers as given.

First.—Already substantially answered; any variation from a direct line will only retard the motion of the water by increasing its friction.

Second.—Only as above described.

Third.—The water will leave no more air when running slowly than when running fast, so long as the stop-cocks are properly adjusted. If the discharge is larger than the orifice in the well, air-bubbles would be likely to enter and work up to the flexures, and there accumulate until the water would be cut off.

Fourth.—It may, as already explained.

Fifth.—The difference is very slight, and due only to the difference of elevation at the points of observation.

Sixth.—The grade should be made as uniform as possible, and the distance to the discharge as short as possible.

Seventh.—You have adopted the very best means attainable, and the only practicable one.

Eighth.—If no air is admitted into the tube, and the entrance orifice is continually submerged, its discharge should be constant.

Air may find its way into your syphon in various ways, even supposing it to be perfectly air-tight throughout its length. Water always contains more or less air, and sometimes other gases, mechanically mixed with its particles. This air or gas may become gradually freed from the water in its passage through the tube—and undoubtedly will. When freed, it will naturally collect at the highest point or crown of the arch; and when that is full it must cut off the water. It would doubtless be well to let the crown of the arch come a short distance beyond the top of the well, and let it represent a much larger circle than you describe—say one with a radius of three or four feet; it will give a much larger air space, and consequently allow the syphon to run much longer without stopping.

Water, in falling, always carries with it a quantity of air. Some of this air immediately escapes, as will be seen by the bubbles which constantly arise from the foot of the falling column. It does not all thus escape, as a certain quantity is evidently entangled among the globules of water, and remains so held for a long time. Water, entirely freed from air, is not pleasant to drink. Those who have visited the water reservoir on the hill near the Protestant Orphan Asylum, in this city, must have noticed that it is so arranged that the water is delivered into one end of the reservoir, and drops over a considerable fall in passing to the other end from which it enters the supply pipes. This fall is for the purpose of aerating it. Much of this air will gradually escape, as the water is allowed to move onward. It is possible that the water from your mine so falls into the well as to allow the "bubbles" of air that would immediately escape to find their way into the suction of your syphon. If so, they would very likely be liberated immediately on reaching the crown of the arch at the top of the well. The water should therefore be dropped into the well as carefully as possible. The pipe should also be constantly submerged, at least twenty inches or more, and the discharge orifice so regulated by its gauge-cock as to be at all times smaller than the entrance

orifice and incapable of discharging any more water than the regular flow into the well. Possibly your gauge-cock in the funnel at the crown of the arch may leak. Keep the bowl of your funnel full of water as a preventive. Perhaps, by carefully guarding against all contingencies, you may make your syphon run longer than it did at the start. If it will run only eight or ten hours, and you have then to start it again, it will be much cheaper than pumping by hand labor—especially if you have a properly constructed suction pump conveniently arranged for ready action.

We should be pleased to hear further from our correspondent with regard to the working of the syphon. We shall also esteem it a favor if any person having any experience or knowledge in relation to the use of the syphon, for mining purposes, would communicate the facts to this office for publication.

A CALIFORNIA SILK FACTORY—AN INTERESTING LETTER.

We have been a long time talking about the initiation of the silk manufacture in California, and that it has not been altogether talk, we have now the tangible evidence of material progress in the matter by the recent return from the East of Mr. Joseph Newmann, who, in connection with Mr. Meyers, has made every arrangement for the early establishment of a manufactory of silk goods, to be located in this city, in the iron building at the corner of Jackson and Battery streets. The gentlemen who have undertaken this enterprise are practical silk manufacturers, having had large experience in the business in Europe.

Mr. Newmann, during his absence, has thoroughly posted himself as to all the most recent improvements in the business, and brings with him twenty looms, with all the other machinery necessary for carrying on the manufacture. He has also brought out a small supply of the raw material, and a number of experienced operatives, in order that there might be no delay in commencing operations.

The company will be known as the "Pioneer Silk Manufacturing Company," and they will have two pieces of black dress silk completed in season for exhibition at the State Agricultural Fair at Sacramento, in September. At present there is not a sufficiency of raw silk produced in this State to supply the factory, and the company will have to depend in a great measure for importations from Japan and China. The establishment of this enterprise, however, by furnishing a ready home market for the purchase of cocoons, as fast as they can be produced here, will so stimulate the production of the raw material that we may with reason hope for a rapid and profitable increase of this new branch of domestic industry in our midst.

LETTER FROM MR. PROVOST.

In reference to the above enterprise, we have been favored with the following interesting letter from Mr. L. Provost, of San Jose, the well-known pioneer silk culturist of this State. The letter will be read with pleasure by all who take an interest in the development of important industrial pursuits on the Pacific coast:

SAN JOSE, August 22, 1866.

EDITORS MINING AND SCIENTIFIC PRESS: Knowing that your valuable paper is devoted to the best interests of the State, I have thought that it might give you pleasure to announce to your numerous readers that we have now fully inaugurated the "Pioneer Silk Factory" on this coast. This is a great event in view of the vast importance of silk culture to California. In my previous letters to the PRESS I have said that we were about to establish this manufacture, and it now affords me the greatest pleasure to state that I have received a visit from my friend, Mr. Joseph Newmann, who has just returned from the States, where he has purchased a complete assortment of all the necessary machinery to take the silk from the cocoons up to manufacturing it in all shapes and styles; in fact, he has brought out everything for a complete silk manufacturing establishment, and at a cost of many thousand dollars, so that he will soon be enabled to manufacture whatever will be most in demand in this market in the silk line.

Mr. Newmann tells me that in visiting the most important silk factories in the States he

has learned that they have in their direct employment about three thousand hands. I am in hope, as we are in the very best silk country in the world, that we shall very soon need that number in this employment in our own State, and I fully believe that the time is not far distant when we will need many more.

I know of a great number of persons who are preparing to enter in good earnest into this rich branch of trade the coming season, and among them are a goodly number that are already familiar with silk culture in their fatherlands. Many more are preparing to come. These are the elements we want to establish the culture, and spread it all over the State. The fact of having our own manufacturing, and, consequently, a market at home for all the cocoons we can produce, will be an increased inducement for many more to go into it. Those who go into the business early will make a good thing of it under present circumstances, especially as they will have a chance to take some of the fine premiums offered by the State.

ADVICE AS TO THE CHARACTER OF SOIL FOR THE MULBERRY CULTURE.

As my ambition is to see all succeed, I feel it my duty to do all I possibly can to impress on the minds of those who intend to go into the business, that to insure a complete success and the largest profits, the most important point is the selection of the soil in which to plant the mulberry trees, which are the foundation of the business, because we cannot hope to raise good silk without plenty of good food. It is true that the mulberry tree will thrive more or less almost anywhere in California; but to obtain a fine luxurious growth, a deep, rich, light, loamy soil is needed. We have any amount of such soil in all the valleys of California. I have observed a great quantity of it in our beautiful San Jose valley, and most of the Sacramento valley is composed of that soil. By what I have seen, and by what I am learning, through correspondence from every part of the State, we have hundreds of thousands of acres of it, so that we have room enough for thousands and even millions of people to engage in the business.

In good mulberry soil trees of seven years' old measure from two to three feet in circumference, and shoot of one year from ten to twelve feet long. What country can beat this? It is very easy to see that in such soils we can obtain as much food from one acre as we could from three or four acres of poorer soils—hence, a great economy of work, and consequently a greater proportionate profit. We have such a quantity of this soil all over the State that all who wish to embark in the business can advantageously come hither from all parts of the world. We have room, and the best kind of land for them all. It is truly incalculable the quantity of silk that can be raised in California. We can supply the whole world with that article!

Mulberry trees ought to be planted on every farm, as the work of raising the silk can be done by the women and children, and all other persons not fit for hard work; and, furthermore, as it is a culture in which we do not fear any competition, we have the whole world for a market. Then it is our interest to engage in it, every one for himself, and also for each to help his neighbor to go into it. We must all go to work, so as to be able, as soon as possible, to retain at home the seven millions of dollars that are annually sent out of the State for the importation of silk, and, furthermore, do all we possibly can to cause the millions already gone out to come back with compound interest. Our ladies should make it a national pride to be able to raise and manufacture their own silk. Respectfully yours,

L. PREVOST.

Mr. Prevost, in a letter to the *Alta*, says: "From all that I can glean, I am of the opinion that from cuttings and seeds over two millions of mulberry trees will be planted the coming season in California."

EXPLORING EXPEDITION.—Gen. McDowell and several other gentlemen, accompanied by Professor Blake, as mineralogist and geologist, left this city yesterday morning on a tour of exploration to the White mountains, in the south-eastern portion of this State. This region is reported to be rich in mineral wealth, and we presume the present expedition will develop some important facts with regard to its resources and value. A company of U. S. soldiers accompanies this expedition. We have been promised some notes of travel by the professor, which will doubtless prove of much interest to our readers.

A GERMAN firm of locomotive builders, who recently completed their thousandth engine, gave a dinner and a dollar to every workman to celebrate the event.

LIST OF OFFICERS OF CORPORATIONS AND MINING COMPANIES.

(PUBLISHED IN THE FIRST ISSUE OF EACH MONTH.)

(Below we give the date of recent meetings held in this city, and the names of officers chosen or appointed. Every mining company is invited to send us the result of their election, to be thus put on record, gratuitously, with any other facts of general interest.)

ETHAN ALLEN G. & S. M. Co.—August 6th. Trustees: Mark L. McDonald, I. N. Greene, James Roberts, Thomas B. Bishop, and J. M. Reynolds. President, Mark L. McDonald; Secretary, H. B. Congdon.

MISA RICA DE LAS FLORES Co.—August 22d. Trustees: Mullot mine, J. Merle, B. Pasquale, L. Blanchard, L. Ponjaddon, A. Dunnington, and A. Enquirts. President, Mullot mine; Secretary, S. Dickinson; Treasurer, A. Borel; Superintendent, A. Bouglival.

SERRA VALLEY G. & S. M. Co.—August 27th. Plumas county, California. Trustees: C. B. Land, Lucius A. Booth, Earl Barlett, A. Dolet, and A. Noel. President, C. B. Land; Secretary and Treasurer, A. Noel; Superintendent, S. R. Palmer.

SWEET VENGEANCE G. & S. M. Co.—August 26th. Trustees: R. H. Elam, Jabez Howes, E. K. Howes, J. R. Spring, F. S. Spring, H. Bendel, A. Pavillier, P. G. Galpin, and J. F. Lohse. President, R. H. Elam; Vice President, J. Howes; Secretary and Treasurer, F. S. Spring.

RECENT INCORPORATIONS.

ALTURAS M. Co.—Idaho Territory. Capital stock, \$40,000; 400 shares. Trustees: John McAdams, Robt. McMillan and Cortland Wood. August 8.

WILEY SPRINGS OIL COMPANY.—Capital stock, \$70,000; time of its existence, 50 years from the filing hereof. 1,400 shares of \$50 each. Trustees: Robt. J. Van Dewater, Lewis Cunningham, A. C. Nichols, R. A. Swain, and Benj. E. Babcock. Principal place of business, San Francisco; place of mining and active business, in the county of Los Angeles. August 8.

NORTHWEST HOMESTEAD ASSOCIATION.—San Francisco. Capital stock, \$25,500; 60 shares; \$425 per share. Trustees: John H. Wentworth, Rev. O. C. Wheeler, D. O. McCarthy, James A. Eaton, and B. F. Moulton. August 4.

NORTH BLOOMFIELD GRAVEL M. Co.—Kumbing Creek, Nevada county. Capital stock, \$400,000; 80 shares; \$5,000 per share. Trustees: L. L. Robinson, B. Pralus and Samuel F. Butterworth. August 7.

ADRIAN GOLD M. Co.—Rock Creek, Sierra county. Capital stock, \$125,000; 2,500 shares; \$50 per share. Trustees: Anson Averell, E. F. Baldwin and Wm. Ireland. July 23.

CALIFORNIA QUICKSILVER M. Co.—Butte, Yolo county. Capital stock, \$870,000; 8,700 shares; \$100 per share. Trustees: Charles F. Reed, Charles W. Reed and Henry F. Williams. August 9.

GOLD QUARTZ COMPANY.—Placer county. Capital stock, \$600,000. Trustees: Archibald C. Peachy, Oden Hoffman, George D. Roberts, Melville Atwood, and Edmund Werthman. August 15.

MOUNT TENABO SILVER M. Co.—Cortez Mining District, Lander county, Nevada. Capital stock, \$782,000; 7,820 shares; \$100 per share. Trustees: Lucius A. Booth, James Mairs, Joseph Sedgely, Thomas Hardy, and J. Preston Moore. August 16.

COSMOPOLITAN HOMESTEAD ASSOCIATION.—San Francisco. Capital stock, \$12,000; 40 shares; \$300 per share; time of existence, three years. Trustees for first three months: T. S. Russell, O. E. Johnson, J. M. Allen, J. N. Hudson, J. L. Jones, Wm. Wistar, Wm. Freeborn, David N. Coy, T. H. Porter, Henry Mohan, and Wm. Hollis. August 20.

SAN FRANCISCO ETHNO-HISTORICAL SOCIETY. City of San Francisco. Trustees: John W. Bwinelle, John T. Doyle, H. H. Haight, Jos. W. Winans, and Louis R. Lull. August 23.

ANCIENT RIVER CHANNEL BLUK GRAVEL CO. Location of claim, county of Nevada, State of California; place of business, county of San Francisco. Capital stock, \$500,000; 5,000 shares; \$100 per share. Trustees: B. F. Moulton, S. Card, Geo. Treat, J. H. Blood, and H. McCormick. August 25.

VEINS OF COAL have been traced to the southern part of Missouri, from the mouth of the river Des Moines through twelve counties into the adjoining Indian territory; from Glasgow, up the Missouri river, to the border of Iowa; and from St. Joseph to Shelby, showing the existence of a coal area of more than 26,000 square miles in the northern and western part of the State.

TO INVENTORS

ON THE

Pacific Coast.

Messrs. DEWEY & CO.

Take occasion to call your attention to the following rules, regulations and suggestions relative to the obtaining of LETTERS PATENT of the United States:

Self-Evident Facts.

Having had large experience, and gratifying success with the great variety of cases emanating on this coast, we feel confident of our abilities to assist inventors in patenting their inventions, saving them from vexatious delays, and from receiving worthless papers by reason of imperfect preparation of their claims before being sent to the Patent Office.

The branch of Patent Law is of itself a SPECIALTY of legal jurisprudence; or, as Mr. Phillips, an eminent Patent lawyer, justly remarked: "The metaphysics of the law."

In early days but little preparation was needed, or but ordinary skill required to obtain a patent; but now, by reason of the multiplicity of inventions, and the numerous acts of Congress, found necessary to protect the inventor while the patent lasts, and to do justice to the people after it expires, the utmost care and skill are requisite in managing cases and obtaining a patent that will be of real value to the Patentee, and stand the test of passing through the legal ordeal of an infringement suit.

The general practice of the Patent office regarding the examination or issue of Letters Patent for inventions has not been materially changed for many years, yet there have been amendments added to the laws of 1861, 1863 and 1866, and which it is necessary for all parties managing an application to be conversant with. Old inventors invariably advise the employment of none but agents of responsibility and experience. As agents with such qualifications, we solicit your patronage.

Confidential Advice.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice we make no charge. A pen-and-ink sketch and description of the invention should be sent together with a stamp for return postage. Write plain, do not use pencil or pale ink; be brief.

Remember all business committed to our care, and all consultations, are kept by us secret and strictly confidential. Our permanent business interests demand, as it were, a sacred compliance with our obligations as solicitors, and in reference to our strict fidelity in this respect we refer to one and all of the hundreds of inventors and patentees on this coast who have patronized us.

Letters Patent.

A patent is an open letter, embodying all the language of an inventor or his agent, contained in the specification, without alteration, and is granted to citizens of the United States, or those who have declared their intention of becoming such, and is signed by the Secretary of the Interior and the Commissioner of Patents, with the seal of the Patent Office affixed. Its jurisdiction is for the whole United States, for the term of seventeen years.

A patent right is personal property, and is assignable, but cannot be seized and sold on execution.

What Claims can be Patented?

A knowledge of Ancient and Modern Mechanisms and familiarity with American and Foreign patent issues and rejections, enables us to determine in a measure in all cases what can be patented, and how much can be claimed as new and novel, and be covered by Letters Patent. This is one of the most difficult questions encountered by both old and new inventors—one in which an experienced counsel is of great service—and yet it can never be positively determined except by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate drawings and payment of the first government fees.

Steps Necessary to Procure a Patent.

The first thing required is a model, if your invention can be represented by one. It is not only immediately necessary in preparing the papers, but the law demands that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions. A less size model will answer when more convenient. It should be neatly made, and of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it in a permanent manner.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention. As soon as the model is ready, it should be carefully boxed and shipped by express, or otherwise, to our address, namely: DEWEY & CO., Mining and Scientific Press, San Francisco. Prepay expenses and send express receipt to us by mail.

A full description must also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance, stating the name and address of the sender. On the receipt of the model and Government first fee of \$15 in currency, the case is duly registered on our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government last fee of \$20 in currency will be required. The law states that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication, as the business can be well done by correspondence.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished, with full description of the entire preparation.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of Government officials, the period is sometimes extended to four or five months, and even more. We make a special point to advance our cases as rapidly as possible.

[To be Continued.]

NEW PATENTS AND INVENTIONS.

TRANSMITTING MOTION.—John Brizee, Alvarado, Cal.: This is a device for transmitting motion or power from a spring to machinery to be operated, and is more especially designed for operating portable or light machines, such, for instance, as washing machines, churns, sewing machines, etc. The object of the invention is to obtain a compact, simple, and efficient device for the purpose specified, one which will not be liable to get out of repair or become deranged by use.

PREPARING CHARCOAL.—G. W. Ferris, Quincy, Ill.: The object of this invention is to remove from charcoal all foreign matter, and prepare the same so as to be particularly fit for clarifying spirituous liquors and also for filtering purposes in general.

STARTING HORSE-RAILROAD CARS.—R. F. Wells, Roxbury, Mass.: This invention relates to means for facilitating the starting of horse cars. It has for its object the obtaining of a simple arrangement of parts to effect the result, and one which will be compact and not liable to interfere or come in contact with obstructions on the road.

STRANGERS visiting San Francisco can use the Burglar-Proof Vault of the CALIFORNIA BUILDING, LOAN AND SAVINGS BANK, California street (one door from Sansome street), for the temporary deposit of Gold Dust, Coin, Bonds, etc., at a small monthly rent, according to the value of the property deposited, for which the Company will be accountable.

A MOTHER'S LOVE.—What sweet poetry is contained in those three little words. Is there a sentence to be found in any language that is more replete with sentiment, beauty, grace, or finish? A mother's love! How noble! How self-sacrificing! How unceasing are her efforts in guiding aright the footsteps of her children! What privations will she not endure; what perils will she not encounter for the sake of her "loved ones!" From our earliest infancy 'tis our mother who watches over us with untiring devotion; who notes every change in our looks, both in sickness and in health. How our hearts bound beneath the loving glances of her soul-lit eyes, as she bends them upon us beaming with a light so pure and holy! With what delight does she listen to our childish prattling, and observe each winning grace! How fondly she gazes upon us, and what a glorious future she paints for us! Then, as thought comes, that as we advance in years, she may be taken from us, and we be left to the cold charities of this world, her heart felt prayer ascends to the Throne of Grace, beseeching Him to guide and direct our steps, so that we may be prepared to meet her in a brighter and better world. Sorrows may come upon us, friends may forsake us, and the world present not one cheering ray, yet will our mother cling to us with a love so abiding that her cheering tones and loving words make us forget the world's rude and bitter jests. Never, on the earth, can we find a friend so steadfast, and one in whom we can repose such perfect confidence as our mother. How holy is a mother's love.

Machinists and Foundries.

PALMER, KNOX & CO.,
Golden State Iron Works,
Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF
MACHINERY,
STEAM ENGINES AND QUARTZ MILLS
DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,
Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S
NEW GRINDER AND AMALGAMATOR
HEPBURN & PETERSON'S
AMALGAMATOR AND SEPARATOR,
Tyler's Improved Water Wheel,
Giving the greatest power, at lower cost, than any wheel in use. There are over 1,500 running, giving universal satisfaction.

KNOX'S AMALGAMATORS,
WITH PALMER'S PATENT STEAM CHEST,
Superior for working either Gold or Silver Ores.
Genuine White Iron Stamp Shoes and Dies
Having been engaged for the past eight years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10q-1f

Notice to Miners,
Well-Borers and Water Companies,
M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, or the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done. **M. PRAG,** 8v13 ly Stove Store, No. 125 Clay street, below Davis.

T. G. DURNING. J. F. FISHER.

PACIFIC FILE FACTORY,
No. 53 Beale Street,
Between Market and Mission streets, San Francisco.

FILES RECTUT AND WARRANTED AS GOOD AS NEW,
or no charge. The only establishment in the State. We also manufacture Reamer and Nower Sections. 8v13-ly **DURNING & FISHER, Prop'rs.**

M. GREENBERG. W. H. MOORE.
GREENBERG & MOORE,
Eagle Brass Foundry,
No. 43 First street, San Francisco,
(Between Mission and Market)

MANUFACTURERS OF all kinds of Brass and Bell Castings; Force and Lift Pumps; Cocks and Valves of every description made and repaired; Oil Globes, Steam Whistles, Hydraulic Pipe and Nozzles (for Mining purposes). Also, COUPLINGS OF ALL SIZES. Particular attention paid to Hydraulic Pipes and Nozzles; also, to Ship Work of all descriptions. All orders from the interior will be attended to with promptness and dispatch. 23v12-3m

LEWIS COFFEY. J. S. ALSDON.
LEWIS COFFEY & RISDON,
Steam Boiler & Sheet Iron Works.

THE only exclusively Boiler Making establishment on the Pacific Coast owned and conducted by Practical Boiler Makers. All orders for New Work and the repairing of Old Work, executed as ordered, and warranted as to quality. Old Stand, corner of Bush and Market streets, opposite Oriental Hotel, San Francisco.

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, Screw and Drop Presses, Coining Machinery, File Drivers, Bark and Malt Mills, and all kinds of Castings.
ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Bekart's Adjustable Cut-off Regulator—best in use; W. E. Bekart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.
BOILERS.—Locomotive, Plate, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.
PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS,** of all sizes.
OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.
Russia Iron Screws, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.
H. J. BOOTH. GEO. W. FRESCOTT. IRVING M. SCOTT.
24v12 **H. J. BOOTH & CO.**

Vulcan Iron Works Company
(ESTABLISHED 1850.)
First, Natoma and Fremont Streets.

IRON FOUNDERS,
Steam Engine and Locomotive BUILDERS,
Boiler Makers, and Workers in Sheet Iron, Brass and Copper.

These Works have lately been increased by the addition of new shops on Fremont Street, doubling the capacity of the original establishment. Their facilities for turning out machinery promptly and efficiently, are now unequalled in the State. Their Boiler Works have also been enlarged correspondingly.

The Company are prepared to execute orders for all classes of Machinery and Boiler Work, such as

Mining, Steamship, and Steamboat Machinery,
Railroad Machinery, Flouring Mills, Quartz Mills, Car Trucks, Sugar Mills, Car Wheels, Saw Mills, Hoisting and Irons; and
Manufacturing Machinery of Every Kind.

Sole Manufacturers of
HEPBURN & PETERSON'S REDUCING PAN AND AMALGAMATOR
BEATH'S AMALGAMATOR;
HESE & MOORE'S IMPROVED HOWELL QUARTZ CRUSHER;
BAUX & GUDON'S AMALGAMATOR AND SEPARATOR;
FAUCHER'S QUARTZ GRINDER AND WATER WHEEL;
JONVAL'S IMPROVED WATER WHEEL;
LEFFEL'S AMERICAN DOUBLE TURBINE WATER WHEELS.
STEVEN'S PISTON PACKING RINGS.
They have also a large assortment of Patterns for Pumping and Hoisting Machinery, Gearing, Pulleys, Water Mill Irons, Hydraulic and Screw Presses, Retorts, Furnaces, Grate Bars, House Fronts, Ornamental Fence Posts and Pailing, Stove Ranges, etc., etc.

Screw Propellers of all kinds, and Steam Boat Machinery generally, made to order, and warranted to give perfect satisfaction in every particular. 25v12-3m

(Written for the Mining and Scientific Press.)

From Sierra County.

BY AN INDEPENDENT CONTRIBUTOR.

(Continued from page 114.)

EDITORS PRESS.—En route from Summit City, with her igneous rocks, her boarded veins, impregnated with metalliferous sublimates from Pluto's dominions, her beautiful lake of crystal waters, with her monster town, built in advance of her requirements, her venerable "parients," the "Old Man and Old Woman mountains," with their storm-stained and weather-beaten faces standing in solemn grandeur, chiding her forward children for their idolatrous worship of Munmon, we enter the southerly boundary of Sierra county, apparently in close proximity to the Downieville Buttes, but in reality about ten miles distant. The formations here are metamorphic schists, with numerous veins coursing through them, at a point nearly south of the Dowieville Buttes, and some three miles distant we find the

KEYSTONE MINE.

A property that has rapidly increased in value under the present management. A few years ago this mine was considered comparatively worthless, notwithstanding it had previously paid well. A former superintendent, from a misapprehension as to the strike of the vein, had run an expensive level through adamantine rock into the hill, and parallel with the lode, for some 400 feet; not cutting the lode at the point anticipated, and the company owing a heavy indebtedness (incurred in building their mill), the creditors foreclosed and the property was sold under the hammer for a nominal sum. The present proprietors and purchasers had the good sense to employ a surveyor, who put them on the right track. Two hundred feet of a cross-cut, at right angles with the level already cut, opened up the vein, well defined, 100 feet under old workings, showing a much richer class of ores, and developing a fine property. Recently a shaft has been sunk on the vein eighty feet in depth, as a further test. The vein was found to increase in power and quality of ores as depth was attained, which has given them encouragement to start a new level 300 feet under the present, which will afford backs for many years of profitable workings. This vein is about four feet wide at the bottom of the shaft, composed of quartz of a conchy or banded structure, containing a very rich class of auriferous iron pyrites, with occasionally a little galena and blende occurring in siliceous talcose slate walls.

The schists are here found highly mineralized and metamorphosed, being near the line of contact with the main eruption belt of the Sierras, which consists of granitic traps, porphyry and associate rocks. In this vicinity we find several companies prospecting and developing lodes, some of which show rich prospects of free gold, and others heavily sulphureted veins, which I am informed give good results by assay. I find the metamorphosed schists extend westward at right angles with the stratification (which is N. N. W.) for some three miles, with occasional outbreaks of porphyry and trap. The whole formation, however, is cut by numerous veins of quartz—as a rule, cutting the stratification at a greater or lesser angle, but sometime conformable to it. Their general characteristics indicate the true fissure vein. VIJADOR.

August 25, 1866.

A Rare Chance!

A Splendid Business in Alameda County.
FOR SALE AT A GREAT BARGAIN,
400 ACRES OF LAND,
INCLUDING
Landing, Wharf, Three Capacious
Warehouses,

Capable of holding 12,000 Tons, which amount of grain was stored and shipped the past year. Connected with said business there is an extensive Lumber Yard; sales during last year, two million feet, which sales, and the entire business, can be largely increased.

The above is a rare opportunity for parties desirous of engaging in an active business that will pay a large dividend on the investment. Satisfactory reasons given for selling, and all information desired can be obtained on application by mail, or otherwise, to

G. F. SMITH,
Notary Public and Searcher of Records, office "Beatty House," San Leandro.

Book Printing should be considered and treated as one of the higher branches of the "Art of Arts," and execution entrusted only to experienced and intelligent workmen. Strict attention will be given to all orders for Book and Pamphlet Printing entrusted to the Mining and Scientific Press Job Office.

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

Rheumatism!!

READ IT! READ IT!!

SACRAMENTO, April 16th, 1866.
H. BOWMAN—DEAR SIR: THIS IS THE FIRST WRITING I have done in two years, and it affords me great pleasure to be able to use my pen in the service of those who are suffering, as I have suffered, by stating the following facts:

I have for two years and upwards been afflicted with RHEUMATISM, and until a few weeks ago I have never found anything that afforded me any relief. For three months of the time I was unable to feed myself, and for the last five months my arms have been so bent that I have not been able to dress myself. I was five months at the Warm Springs, at San Luis Obispo, and three months at a Hydropathic Institute in Stockholm, and I have been under the care of six different physicians, in the vain hope of relief. About four weeks ago I was induced by a person who had been cured by it to try a bottle of RICHARD'S REMEDY FOR RHEUMATISM, and in less than twelve hours I experienced great relief. In a few days I was enabled to straighten out my arms, and I have been getting better and gaining in strength and flesh ever since. I have now the complete use of all my limbs, and, for the first time in two years, I am out of pain. I do feel for those who suffer as I have suffered, and if they will take my advice, they will lose no time in giving the REMEDY a trial. Yours truly, GEORGE TAYLOR.

Richard's Remedy is for sale by H. BOWMAN, Druggist, Sacramento. 2v12 Price, \$2.50 per Bottle.

COPPERAS! COPPERAS!

200 BARRELS COPPERAS—SULPHATE OF IRON. For sale, in lots to suit, BENJAMIN BRADY,

103 California street, South-west corner of Davis, up-stairs. 2v12

Capitalists, Attention!

QUARTZ MILL & MINING PROPERTY
FOR SALE
In Nevada County.

A NEW 8-STAMP QUARTZ MILL, 7 LEDGES AND 640 acres heavily-timbered Land, near Eureka, Nevada County, are now offered for sale. The Mill is run by steam-power, and is in complete order for business. The ledges, which form the principal value of this property, are all large and well-defined, but require a further outlay of capital, in order to make them remunerative. For the lack of claims to properly develop these claims, the present owners are disposed to sell the same for a reasonable price.

Capitalists wishing to engage in mining will find this a splendid opportunity to purchase a property that will bear right scrutiny, and offers superior inducements as an investment.

For address and further information, inquire of the Publishers of the MINING AND SCIENTIFIC PRESS, 505 Clay street, San Francisco. 2v12

HAYWARD, COLEMAN & CO.,
IMPORTERS AND REFINERS

Illuminating, Lubricating,
PAINT OILS!

CONSISTING OF
KEROSENE, LARD, SPERM, ELEPHANT, POLAR, TANNERS', NEATSFOOT, BOILED AND RAW LINED, CASTOR AND CHINA NUT.

—ALSO—
SPIRITS OF TURPENTINE & ALCOHOL

Note.—We would specially call the attention of Mill owners and Engineers to our superior PARAFFINE OIL, which we manufacture from the California Petroleum. This Oil will not gum. Machinery thoroughly cleaned and lubricated with it will not heat, and after remaining at rest, can be started without cleaning off.

A sample can of our Paraffine Oil will be forwarded on application to us, as we desire a fair and impartial trial.

Lamps and Lamp Stock!

An elegant and complete assortment on hand. 4v13-3m 19 414 Front street, San Francisco.

THE CALIFORNIA

Aerated or Unfermented
BREAD COMPANY.

Bakery on Folsom Street,
Between Tenth and Eleventh.....SAN FRANCISCO

MESSRS. TAGGART, BULKLEY & DUFF, HAVING ASSOCIATED themselves in partnership, are happy in announcing to the public that they are now prepared, and would respectfully sell it, all orders for his truly whole-some and cleanly bread. We have a sufficient number of delivery wagons at our bakery to guarantee to all who may favor us with their patronage a prompt delivery of fresh bread daily, Sundays excepted.

Through the kindness of the gentlemen of the following named firms, we are privileged to keep an order box for the entry of all orders for the bakery so that they may reach our earliest attention:

Order box at C. J. Hawley & Co.'s Grocery, corner Second and Jessie streets; Rowland & Walker, 617 Clay street; Plummer's Carpet Store, Montgomery street, opposite Lick House; G. W. Clark, Paper Hanging, corner Sansone and Clay streets. Orders handed to any of the route-men likewise. We expect soon to be prepared to supply Pastry, likewise the Boston Brown Bread, and Beans of the first quality. Due notice will be given.

The present Company is entirely independent of the former California Unfermented Bread Company, neither of them having been in any way connected with that company. We would cordially invite the public to make a visit to our new bakery. 4v13-3m S. R. BULKLEY, Business Partner.

EUROPEAN
METALLURGICAL WORKS,

—AND—
Practical Mining School,
Bryant Street, Between Third and Fourth,
SAN FRANCISCO.

THE PROPRIETORS are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyrites, and the so-called "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

SAN FRANCISCO.

AN INSTITUTION DESIGNED TO PREPARE YOUNG and middle-aged men for an active and successful business life.

BOOK-KEEPING, PENMANSHIP, COMMERCIAL LAW, COMMERCIAL ARITHMETIC, CORRESPONDENCE, MODERN, LANGUAGES, ETC.,

Practically taught. - 25

This College forms a link of the
American Chain of Commercial Colleges,
Located in the principal cities of the United States, and is the only institution on the Pacific coast conducted on actual BUSINESS PRINCIPLES.

Regular Banks and Business Offices have been introduced,

By which we are enabled to fit out Students in the BEST POSSIBLE MANNER, and at the LEAST EXPENSE of time and money, for the practical duties of the Counting House.

Students can enter at any time of the year, there being no vacations. Each student receives individual instruction, with the exception of Lectures and other general exercises.

The College Review,

Giving full particulars of the College, can be had FREE, by calling at the College, or addressing
E. P. HEALD,
3v13 President Business College, San Francisco.

SANTA CLARA COLLEGE, S. J.,

SANTA CLARA, CAL.

Conducted by the Fathers of the Society of Jesus.

The SIXTEENTH ANNUAL SESSION of this College will commence on
Monday, August 20th, 1886.

TERMS.—Tuition in the Classical and Scientific Department; Boarding and Lodging; Washing and Mending of articles washed; School Stationery; Medical Attendance and Medicine; Fuel, light, baths, etc., per session of ten months. \$350

For further information and catalogues, apply to the President of the College, or to Rev. A. Maraschi, St. Ignace College, Market street, San Francisco. 5v11-1au12
REV. A. MANSATA, S. J., President.

SEND US WORK.—If any subscriber to this journal fails to receive the same regularly and promptly, they will con for a favor by informing us at once.

Our Patent Agency.

The PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

THE MINING PRESS is particularly the miners' journal, and is doing more for the solid interests of the State than any other, by enabling its readers to unlock the mines of untold wealth which lie waste around them.—[Mountain Messenger.

SAN JOSE INSTITUTE

Commercial College,

SAN JOSE,
Santa Clara County, California.

THE NINTH SESSION WILL COMMENCE ON THURS.

DAY, July 25th, 1886.
A new, practical and complete Business Course has been adopted, differing from that of any other school in the State. We call the especial attention of Business Men, or those wishing to give their sons a thorough, practical Business Education, to this fact, and request them to send for a Circular before deciding what School they will pat onize. Ample accommodations for boarders in the Seminary. Ornaments, Music, Ancient and Modern Languages taught.

Special arrangements have been made for boys between the ages of ten and eighteen.

For further particulars or Circular, address

New Mining Advertisements.

Assurance Mining Company.—Location: Ocidental Lode, San Benito Mining District, County of Monterey, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-third day of August, 1886, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, Room No. 4, 302 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-fifth day of September, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Friday, the twelfth (12th) day of October, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

H. H. RUSSELL, Secretary.

Office, Room No. 4, 302 Montgomery street, San Francisco. 1v1

Arbitros Mining Company, Batopilas District, State of Chihuahua, Mexico.
Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirtieth day of August, 1886, an assessment (No. 11) of one dollar (\$1) per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his Office, No. 811 Montgomery street, up stairs, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the third day of October, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Friday, the twenty-sixth day of October, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. MARTINSON, Secretary.

Office, 811 Montgomery street, San Francisco, Cal.

N. B.—Until further notice, all advertisements of this Press will appear in the "Mining and Scientific Press."

Chilpanca Mining Company.—District of Ures, Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-seventh day of August, 1886, an assessment of two dollars and fifty cents (\$2.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, 318 California street, up stairs, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-eighth day of September, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fifteenth day of October, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.

Office, 318 California street, San Francisco, Cal. 1v1

And in accordance with law, and an order of the Board of Trustees, made on the thirtieth day of July, 1886, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Secretary, 609 Market street, San Francisco, Cal., on the fifteenth day of September, 1886, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

S. S. SWEET, Secretary.

Office, No. 609 Market street, San Francisco, Cal. 1v1

Nuestra Senora de Guadalupe Silver Mining Company, Tayolita District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company held on the twenty-fifth day of June, 1886, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. Pfeiffer, at the office, No. 210 Post street, or to the Treasurer, A. H. H. H. H., at his office, No. 557 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the first day of October, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the thirty-first day of October, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

E. J. PFEIFFER, Secretary.

Office, 210 Post street, San Francisco, Cal.

N. B.—The above is assessment No. 24, levied on June twenty-fifth, 1886, and now re-advertised, in accordance with an order of the Board of Trustees, at a meeting held on the thirtieth day of August, 1886. The omission to complete the advertising, in accordance with the first order, occurred by delay in order to receive news from interested parties in New York City. E. J. PFEIFFER, Secretary. San Francisco, August 30th, 1886. 1v1

San Marcial Silver Mining Company.—Location:

Marcel District, Hermosillo, State of Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-seventh day of August, 1886, an assessment of one (\$1) dollar per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, No. 31 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the thirtieth day of October, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the twenty-first day of November, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. N. VAN BRUNT, Secretary.

Office, 331 Montgomery street, San Francisco. 1v1

And in accordance with law, and an order of the Board of Trustees, made on the twentieth day of July, 1886, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., No. 418 Montgomery street, San Francisco, on the eleventh day of September, 1886, at the hour of one o'clock, P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

H. O. HOWARD, Secretary,
Office, 623 Montgomery street, San Francisco. au25

Lady Bell Copper Mining Company, Low Divide District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the third day of August, 1886, an assessment of ten cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, 311 Market street, San Francisco, or to G. W. Russell, Crescent City.

Any stock upon which said assessment shall remain unpaid on the fourth day of September, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-fourth day of September, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

C. H. WOOD, Secretary,
Office, 311 Market street, San Francisco, Cal. au1

Lady of the Lake Gold and Silver Mining Company, San Francisco District, Mohave County, Arizona Territory.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 21st day of July, 1886, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Alonso Young.....	77	50	\$25 00
Alonso Young.....	78	73	36 50
Sarah Mitchell.....	93	25	12 50
Sarah Mitchell.....	74	25	12 50

And in accordance with law, and an order of the Board of Trustees, made on the 21st day of July, 1886, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company in San Francisco, Cal., on the tenth day of September, 1886, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

WM. HOLLIS, Secretary,
Office, 302 Montgomery street, Room 2, third floor. au25

Mina Rica de las Flores Mining and Mill Company, Camp Flores, near West Point, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-first day of August, 1886, an assessment (No. 13) of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 423 Washington street, Room No. 13, up stairs, San Francisco, Cal., between the hours of 11 A. M. and 1 P. M.

Any stock upon which said assessment shall remain unpaid on the second day of October, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-ninth day of October, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

S. DICKINSON, Secretary,
Office, 423 Washington street, San Francisco, Cal. au25-6t

Old Colony Silver Mining Company.—Location of Works: Austin, Reese River, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventh day of August, 1886, an assessment of five (\$5) dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, 525 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the seventh day of September, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eighth day of October, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

HENRY O. HOWARD, Secretary,
Office, 525 Montgomery street, San Francisco. au1

Rattlesnake Gold and Silver Mining Company, Spring Valley District, Yuba County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighth day of August, 1886, an assessment of one (\$1) dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 318 California street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twelfth day of September, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the third day of October, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOISE, Secretary,
Office, 318 California street, San Francisco. au1

Simpson Mining and Milling Company, Mokelumne District, Alpine County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the third day of August, A. D. 1886, an assessment of thirty cents per share was levied upon the capital stock of said Company, payable by the fourth day of September next, in gold coin of the United States, to the Secretary, at his office, southwest corner of Front and Jackson streets, up stairs, San Francisco, State of California.

Any stock upon which said assessment shall remain unpaid on the fourth day of September, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on the twenty-fourth day of September next, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. BIGELOW, Secretary,
Office, southwest corner of Front and Jackson streets, up stairs, San Francisco, State of California. au1

Segregated Belcher Mining Company, Gold Hill District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourteenth day of August, 1886, an assessment of five (\$5) dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, 318 California street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the fourteenth day of September, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on the twenty-fourth day of September next, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOISE, Secretary,
Office, 318 California street, San Francisco, Cal. au18

Scott Mining and Exploring Company.—Location of Mines, etc., in Humboldt County, State of Nevada.

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; a, Dies; c, Shoes, and o, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan when properly constructed, are respectively 177, 118 and 132.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes direct from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the **PACIFIC FOUNDRY,** San Francisco.

LEFFEL'S American Double Turbine

THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given universal satisfaction whenever used, is now for sale by **KNAPP & GRANT,** 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These Wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 50 feet fall. Let us know how much water you have either in miner's liches or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to **KNAPP & GRANT,** San Francisco.

Leffel's Lever Jacks,

For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks, for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind. For sale by **KNAPP & GRANT,** San Francisco.

The Hansbrow Pumps ARE WARRANTED THE BEST.

FIFTEEN KINDS AND SIZES, I
Adapted for FARM,

Mill and Mining Purposes.

Placed for
HAND, WIND, HORSE, WATER AND STEAM POWER.
For sale in every city and town on the Pacific Coast.

Send for Illustrated Catalogue. 2312-2m

BAUX & GUIOD'S Separator and Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine Scientific Knowledge with Practical Experience, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgamators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The tripping cost for attendance; its small cost; its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping as it is constructed to work continuously. The complete thoroughness of the separation of the rock from the metals and the tripping power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crall's Gravel Cement Works, Nevada county; Waltham's Chlorination Works, Nevada; Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Heugb & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,
Premont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 413-6d

It tells us truly the Minute, Hour, Day of the Week and Day of the Month.

HORTON'S PATENT CALENDAR CLOCK!

MANUFACTURED BY THE
ITHACA CALENDAR CLOCK COMPANY,

Ithaca, N. Y., and for sale by

W. J. EGBERT, Agent.

At Job M. SEAMAN & Co's, 631 WASHINGTON STREET,
San Francisco.

THIS TIME PIECE costs but a trifle more than any other good clock, and is just the article for every well-regulated business house, office, saloon, or, in fact, any place where a handsome, perfect time-keeper is duly appreciated. The Clock has two dials, the first being the same as an ordinary clock; the second has but one pointer, and shows the day of the week, the month and day of the month. It is arranged to mark the days in leap years with equal regularity. It is an everyday piece, and runs from year to year without change. It can be examined at the Office of the Mining and Scientific Press. 2313p-1f

To Ditchmen, Millmen and Others Requiring IRON PIPE.

M. R. ROSE, CORNER OF 9TH AND K STREETS, Sacramento City, has facilities unsurpassed on this coast for the manufacture of IRON PIPE of every description. He also has on hand a deep well FORCE PUMP, of his own invention and manufacture, well adapted for oil wells. His tools being portable, pipe can be manufactured on the ground. 1912

EXCELSIOR PUMP!

HOOKER'S PATENT!

CHALLENGES COMPETITION!

THIS DOUBLE-ACTING SECTION AND FORCE PUMP challenges competition for simplicity, durability and power, and will work at any depth. The pistons for Mining Pumps are packed with hemp. The valves are reached by simply removing the "bonnets," thereby avoiding the trouble of raising a long column of pipe. They will raise as much water as TWICE their size of single-acting Mining Pumps, and are sold at half the price. We have never heard of the valves in this Pump being out of order. For their many superior points they are fast replacing all other Force Pumps. Reference can be given where this Pump is working with eighteen others of different patterns and is pronounced THE BEST; also, from some of the best miners in the State who have them in use. For manufacturers, farms or domestic use, we warrant them the best and cheapest. All sizes adapted to any power or any purpose. For sale by agents throughout the State.

perfectly pure and healthy. Three sizes. Price, \$12,
\$15 and \$18. For sale by

S. B. STODDARD,
Corner of Battery and Pacific streets
June 23, 1866 2312-3m

Union Amalgamator.

This Valuable Invention

IS FAST FINDING ITS WAY INTO GENERAL USE, NOT by means of combination of capital and influence, but on the strength of its own merits, and upon the principle that what is known to be good will be appreciated. Practical men acknowledge the UNION PAN to be scientific, the best, the cheapest, and most profitable. It now stands first on the list of all pans in use for the purpose of

Working Gold and Silver Ores.

It has been found that a low class of ores, also tailings from Mills, Sulphurets, etc., that will not pay to work with the common pans, may be worked with this and obtain large profits. The UNION PAN is manufactured in two sizes, and capable of operating upon large quantities of ore in the most efficient manner.

Parties interested in Quartz Mining, Mills, etc., will find it to their advantage to call and examine for themselves, and see its operation.

Cold and silver ores tested by regular mill process, at moderate cost, by

STRONG & CO.,

San Francisco Foundry, corner Mission and Fremont streets, where orders will receive prompt attention. 1512-3m

BRUCKNER'S Mechanical Roasting Furnace

AWARDED A

PREMIUM SILVER MEDAL

—BY THE—

The Mechanics' Institute.

THESE FURNACES ARE NOW MANUFACTURED AFTER an improved mode of construction, which GREATLY SIMPLIFIES THEIR OPERATION,

and afford a much larger oxidizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

THE IMPROVED FURNACE

May be seen in operation, for desulphurizing or roasting and chloridizing, at Central Mill, Virginia City, Nevada.

Parties wishing to erect such Furnaces, are requested to leave their orders with

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most economical mining advertising medium in this city. Our terms are less than ours but the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

A DROP OF INK.—Think of a queen's first signature to a death-warrant, where tears tried to blanch the fatal blackness of the doom ink; or a traitor's adhesion to a deed of rebellion, written in gall; of a forger's trembling imitation of another's writing, where each letter took the shape of the gallows; of a lover's passionate proposal written in fire; of a proud girl's refusal written in ice; of a mother's dying expostulation with a wayward son written in her heart's blood; of an indignant father's disinheriting curse on his first born, black with the lost color of the gray hairs which shall go down with sorrow to the grave—think of these and of all the other impassioned writings to which every hour gives birth, and what a strangely potent, Protean thing a drop of ink grows to be!

All over the world it is distilling at the behest of men. Here a despairing prisoner is writing with a rusty nail his dying confession of faith on his damp dungeon wall. There an anxious lover is deceiving all but his bride with an ink which only she knows how to render visible. Belonged soldiers in Indian forts are confiding to the perilous secrecy of rice-water or innocent milk their own lives and the fortunes of their country. Shipwrecked sailors, about to be engulfed in mid-ocean, are consigning to a floating bottle the faint pencil memorandum of the spot where they will swiftly go down into the jaws of death. Everywhere happy pairs, dear husbands and wives, affectionate brothers and sisters, and all the busy world are writing to each other on endless topics, with whatever paper comes to hand, whatever ink! The varied stream thus forever flowing is the intellectual and emotional blood of the world, and no one need visit Egypt or summon an eastern magician to show him all the acts, all the joys and woes of men reflected from the mirror of a drop of ink.

A BEAUTIFUL SENTIMENT.—Shortly after the departure of the lamented Heber for India, he preached a sermon which contained this beautiful illustration:

"Life bears us on like the stream of a mighty river. Our boat at first glides down the narrow channel—through the playful murmurings of its grassy borders. The trees shed their blossoms over our young heads, the flowers seem to offer themselves to the young hands; we are happy in hope, and grasp eagerly at the beauty around us, but the stream huries on, and still our hands are empty. Our course in youth and manhood is along a deeper and wider flood, among objects most striking and magnificent. We are animated at the moving pictures and enjoyment and industry around us; we are excited at some short lived disappointment. The stream bears us on, and our joys and our griefs are alike left behind us. We may be shipwrecked, but we cannot be delayed; whether rough or smooth, the river hastens on till the roar of the ocean is in our ears, and the tossing of the waves is beneath our feet, and the floods are lifted up around us and we take our leave of earth and its inhabitants, until of our future voyage there is no witness save the Infinite and Eternal."

J. B. CONE, BUSINESS AGENCY.—Makes private sales of Property and Business Places of every description, in the city and throughout the State; procures partners with large and small amounts of money; negotiates sales of mining property, and does a General Agency Business. Patronage solicited by mail, express, or by personal application at the office, 402 Montgomery Street, San Francisco, California. 2v111t

CAUTION!—TO WHOM IT MAY CONCERN.—THE public are hereby notified that a patent was allowed Dec. 24, 1864, and issued June 27th, 1865, to Professor Henry Wertz, for the use of Sodium and Amalgams thereof with quicksilver, in the extraction of precious metals from their ores. All persons using said Amalgams, or purchasing or selling Sodium or said Amalgams, for use in the treatment of gold or silver ores, are hereby cautioned that they will be prosecuted to the full extent of the law.

SODIUM OR MAGNETIC AMALGAM.

THE WERTZ AMALGAMATION COMPANY,
OF NEW YORK.

Assignees of letters patent granted to Prof. Henry Wertz, the discoverer of the use of Sodium in the amalgamation of gold and silver ores, having established an agency in San Francisco, now offer to the mining community their amalgams, with full directions for their use, on the MOST LIBERAL TERMS. A large supply of the Amalgam, of any required strength, constantly on hand.

The terms and conditions upon which rights to use the process are obtainable, can be had on application to

FOR SALE CHEAP.

A GOOD TYPICAL COLLECTION OF

NEVADA MINERALS,

Silver, Lead, Copper, Iron, Salt, Sulphur, etc.—about nine hundred specimens—carefully labeled, with Catalogue.

For terms, apply to this office, or to S. H. R., Virginia, Nevada. 6v13-1m

Subscribe for it.—The large, illustrated sixty-four column weekly newspaper—the San Francisco Mining and Scientific Press—should be taken by every miner, prospector, and intelligent citizen throughout Colorado, as it gives a mint of most useful information to be gained no other way, on mining matters generally.—[Rocky Mountain News.

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price. These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes. Steam can be run up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels, to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with an without engines.

Also, Portable Saw and Grist Mills.

For sale by **TREADWELL & CO.,**

Corner of Front Market and streets. 15v12

RAILROAD TRACK-LAYING MACHINE.

We made a brief mention last week of a new invention for laying railroad track by machinery. According to the *Humboldt Register*, it has been carefully examined by the County Surveyor of Humboldt, and also by an experienced railroad engineer, both of whom are highly pleased with the machine, and think it not only practical, but just the thing needed. The principle on which it works is so simple that those gentlemen express astonishment that it has not before been thought of. A machine for laying railroad track may at first thought be deemed almost chimerical; but after reading the following description, which we clip from the *Humboldt Register*, and keeping in mind the vast and increasing amount of this description of labor that is being called for, one may well look upon it, if successful, as among the most valuable mechanical improvements of the age. The inventor is Mr. W. D. Robertson, of Star City, Humboldt county, Nevada:

The machine is supplied in front with a movable scraper, to cut down or fill up irregularities of ground after hand grading. Immediately behind the scraper is a feed box, into which the ties are thrown, and by rods worked by cams or eccentrics, are dropped at any given distance apart. This apparatus is similar to and as simple as the lever on a shot-pouch, for putting regular charges in a shot gun. Following the feed box, a battery of four stamps is arranged to drop at the same regular intervals that the rails are dropped; the stamps set the tie firmly in the ground, and retain it in position until revolving cutters—like those used in planing-machines—pass across and cut the tie to the grade to receive the rail; these cutters are adjustable, and may be made to cut the tie to any required depth. As soon as a sufficient number of the ties have been laid and cut, a rail, with a chair properly placed, is lowered to the ties and driven back into the chair on the preceding rail. A very simple (though difficult to explain without drawings) apparatus follows, and sets the spike in each tie; and they are driven home by one or more stamps following and each giving it a blow, but cannot fall so as to batter the head after it is driven. The ties and rails are supplied by hand cars on tracks on platform of main car, these cars running back on the cars of the supply train. The whole machinery is driven by gearing, belts, etc., from the wheels of the car, and the whole may be driven by a common locomotive—moving the supply train—or by a small engine on the construction engine.

The whole machinery is arranged on true mechanical principles, and there is no more reason to doubt the accurate working of all the parts of it, than there is to doubt the proportionate movements of these several bands of a watch. I had the honor of making the drawings for the Patent Office, and am thus familiar with its arrangements. It has been examined by several engineers and railroad men, and none doubt its final success.

Yours, etc.,
J. S. HENNING, Civil Engineer.

P. S. Since writing the above, Mr. R. has made some important improvements in the machine. They consist of an apparatus on the rear of the construction car for bending the rails for any given curve, and a little different arrangement of the machinery or gearing—making it more simple, lighter, and occupying less space than in the plans you have seen. I am now engaged in making a new drawing, and will send you a copy.

The machines is calculated to build road at this rate of quarter of a mile per hour, and may be covered by tent or oil-cloth and accompanied by sleeping and cooking cars, so as to run night or day or in any weather.

J. S. H.
THE SIERRA NEVADA MINE, Storey county, Nevada, has its new shaft down 510 feet. Drifting is now being done on the 300 and 500-foot levels for the ledge, which is supposed to be near at hand. We are informed that the work of development is going forward with all possible dispatch, and that the prospects are flattering.

CALIFORNIA INVENTIONS.—We have quite a number of California inventions on file for notice, which are crowded out this week; but for which we shall find room in our next issue. There appears to be unusual activity among inventors on the Pacific coast at the present time.

OTTO OF ROSES contains the same elements and in the same proportions, as coal gas.

HUNGERFORD'S IMPROVED CONCENTRATOR,

FIG. 1.

For Saving Gold, Sulphurets, Quicksilver, Etc.

FIG. 2.

There is no description of machinery of so much importance to the mining interests of California, at the present time, as that for the separation of sulphurets. Mines are now abandoned, or, what is worse, paying assessments which, if the sulphurets were saved, would yield handsome dividends. Great difficulty, owing to the varied form and character of the sulphurets, has been experienced in devising a machine to separate them, and it is only by close and patient observation, persevering study and careful experiment, that any machine can be made or matured so as to save a high per centage of the sulphurets which are in the ore. No machine is so perfect as to save all; and the best is that which will save most with the least expenditure of time, money, and power. Many machines have been tried, and many abandoned; all of which have been unable to meet the requirement of the mining interest, as well as that now patented by Mr. Hungerford, which is an improvement on the well-known Hungerford & Fater Concentrator, with which his name is already so familiar.

The separating or concentrating action is obtained by centrifugal force and gravitation; the pulp being preserved by water in the proper condition for the operation, and the pan so constructed, mechanically, as to allow the centrifugal force and gravity to expend themselves to the best advantage in producing the separation, as well as to make the machine simple, compact, and easily kept in order.

Fig. No. 1 is a perspective view of the Concentrator while in operation, showing the general arrangement. Fig. No. 2 is a section through the centre of the pan, showing how it operates in separating the sulphurets, as well as the great improvement to the pan, which consists of the addition of a circular trough outside the periphery. Its operation is as follows: The pulp flows from the spout through the filter into the bowl at the top, from which it is distributed equally over the convex cover into the pan near its outer edge. The lightest sand is at once carried off with the overflowing water through the centre opening, and the sulphurets are allowed, from the motion given to the machine, to gravitate to the bottom toward the outer edge, forming an embankment all around the pan, as represented at 1, 1, Fig. 2. The lighter particles of the sand arrange themselves on the top at 2, 2, Fig. 2, from which they are being constantly washed away with the water flowing through the central opening. The sulphurets are, by the centrifugal motion of the machine, made to pass through small openings at the bottom, at intervals of a few inches around the circumference, through the inner wall of the pan to the circular trough, 3, 3, Fig. 2, where they come in contact with the mercury at the bottom, depositing the free metal, from which it is drawn at pleasure by an opening in the bottom, and the sulphurets, in the order of their density, by openings in the sides.

It will be observed that the sulphurets in the trough, 3, 3, are maintained at the same elevation as the sulphurets and overlying sand in the body of the pan. It will be further observed, that by no possible means can the sand in the latter pass to the former in such quantities as to form any considerable percentage of the amount saved. The advantages of this improved pan are continuous action, requiring no attention except to remove the receiving vessels as fast as they are filled from the openings shown on the right of Fig. 2, simplicity in construction, and durability and cheapness of cost.

The pan derives its motion from two eccentrics secured on a horizontal shaft passing across and below the centre of the pan and working between two pairs of adjustable wooden guide blocks or bearings. The eccentrics are so made as to bear equally on the wooden guide blocks in all positions while in motion; giving to the pan the most desirable motion for its purpose, and doing away with all complexity of rods, cranks, wooden frame, etc.

These pans are now being introduced into the best mills in the country. Reference to parties who have tested them can be had by applying to the manufacturers.

Those interested in mining, and who call at the Miners' Foundry to see the one which is there in operation, will have no reason to regret their visit.

San Francisco, June, 1866.

M. HUNGERFORD,

Miners' Foundry, First Street.

Judicious Resolutions.

Several of our most substantial and judiciously managed mining corporations have passed resolutions, since the approval of the new assessment law, requiring all notice of assessments and sales to be published in the *MINING AND SCIENTIFIC PRESS*, the only thorough (daily or weekly) mining journal on this coast. Our efforts to concentrate all mining advertisements in one paper, for the economical convenience of shareholders and assessment payers, are meeting with decided success. Those who believe in supporting the mining cause, should bear our paper in mind, and bring up this subject at the next trustee or shareholders' meeting.

San Francisco, April 7th, 1866.

New Mining Laws of California and Nevada.

We have just issued, in cheap edition, the new laws relating to mining and corporations in California and Nevada, passed in 1865-6. Some of these laws are of the highest importance to parties interested in the matter of locating and holding claims, and prospecting mines, in these States. Copies sent by mail. Price, 25 cents.

Address, DEWEY & Co., Patent Agents.
San Francisco, May 1st, 1866.

STOCK CERTIFICATES,
STOCK TRANSFER JOURNALS,
STOCK LEDGERS,
ASSESSMENT RECEIPTS,

And all other Blanks, Blank Books, etc., required by Mining and other Corporations, kept on hand or printed to order on short notice, at moderate prices, at the office of the *MINING AND SCIENTIFIC PRESS*.

Important to Californians.—Many inventors have lately had their claims patented, and in some cases fatally delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The *MINING AND SCIENTIFIC PRESS* PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

SUBSCRIBERS who do not receive the *MINING AND SCIENTIFIC PRESS* in due time, are requested to inform the publishers.

Pacific Mail Steamship Co's
THROUGH LINE TO NEW YORK,
Carrying the United States Mail.

LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the 10th, 18th and 30th of each month that has 30 days.

On the 10th, 18th and 30th of each month that has 31 days.

When the 10th, 18th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departures of 18th or 19th connect with French Trans-Atlantic Co's steamer for St. Nazaire, and English steamer for South America.

Departure of 10th connects with English steamer for Southampton, and P. & R. Co's steamer for Central America.

Departure of the 30th connects with English steamer for Panama, the port of the new mines.

The following Steamships will be dispatched on dates as given below:

September 10th—CONSTITUTION, Capt. E. S. Farnsworth Connecting with ARIZONA, Capt. Maury.

September 18th—COLORADO, Capt. J. T. Watkins. Connecting with HENRY CHANCEY, Capt. Gray.

September 29th—SACRAMENTO, Capt. J. M. Gavarly Connecting with OCEAN QUEEN, Capt. Weir.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Inman Line, can be obtained at office P. & R. Co., San Francisco.

For Merchandise and Freight apply to Messrs. WELLS, FARGO & CO.

The splendid steamship COLORADO will be dispatched for CHINA on TUESDAY, January 1, 1867.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

THE SECTION OF THE BIG TREE FOR THE PARIS EXHIBITION.

Dr. Macgowan, who has recently returned from a visit to the "Big Trees," writes as follows to the Chairman of the Committee on the Paris Exhibition:

Mr. W. B. EWER—Dear Sir:—In compliance with the request of Mr. Hoag, Secretary of the State Agricultural Society, and yourself, I have conferred with Messrs. Sperry & Perry, the proprietors of the Big Tree Grove, Calaveras county, touching the preparation of a section of the "Original Big Tree" for the Paris Exhibition. It is a case in which *C'est le premier pas qui coule*; that is to say, a section once made, then the idea of dividing it into pieces, representing the States and Territories of the United States, can be easily carried out. But until a saw forty feet long can be made for the process of amputation, there does not seem any prospect of your being able to carry out the happy conception. The proprietors of the tree will offer every facility, including labor, for the prosecution of the undertaking; but they cannot commence the work without the implement that I have named; but as there is no lack of mechanical ingenuity in this city, and as the public spirit of our citizens is equal to any emergency, I doubt not that America's pride will be gratified by the display, in the French capital, of this wonder of the botanical kingdom. I should suppose that if it were announced that the contributions to the expense of this work might have the right to designate the institution to be its custodian, after the exhibition, the inducement would attract the attention "of well-to-do citizens." Yours truly,

D. J. MACGOWAN.

San Francisco, Sept. 7th, 1866.

RAPID TRAVELING.—An almost or quite unrivalled feat was recently performed on the Great Northern Railway, in England. In a case of great emergency an engine was driven from King's Cross to York, 191 miles, in three hours and forty-three minutes, a fraction over fifty-three miles an hour, deducting eight minutes stoppage for water at Newark. Better time may have been made for a few miles, but we doubt whether anything like 200 consecutive miles has ever been made in so short a time elsewhere.

FRANK A. HILL'S IMPROVED SEED SOWER.

We give annexed an illustration of a new and improved Seed Sower, for which application for letters patent have been made through the MINING AND SCIENTIFIC PRESS PATENT AGENCY, by Frank A. Hill, of Marysville, Yuba county. The construction and operation of this device may be described as follows: The seed is put into the seed-box, A, and as the sower is drawn forward, the beveled gear attached to the inner central portion of the wheels, causes the revolution of the beveled pinion wheels, C, C, which, by a crank attachments, moves back and forth alternately, a set of horizontal plates in which the pins, shown by the light lines in the engraving, are fixed,

FRANK A. HILL'S IMPROVED SEED SOWER.

and by which the seed, with which the main box, A, is filled, is so disturbed as to fall through the holes in the bottom of the box, at e, e, e. These holes or valves may be opened or closed, and thus regulated to the size of the seed, and the quantity which it is desired to scatter by the levers, P, P, placed upon each side of the driver's box.

Through these, holes seed falls upon the scatter board, b, which, by its peculiar shape, spreads the same with great regularity. It is claimed by the inventor, that by the aid of this machine the ground can be seeded with great evenness and ease, as every person who can drive a team can manage the machine with the most perfect facility. The sower is followed by a revolving harrow, which covers the seed perfectly as fast as sown—the whole forming a complete machine for seeding and covering at one operation, as shown in the engraving.

It is one of the most encouraging signs of the times that inventors in California are turning their attention to devising improve-

ments in agricultural machinery. Several important inventions of this description have already been made, among which we may notice prominently several compressing machines for baling hay, wool, etc., two or three cultivators, and a grain elevator, which will be found quite fully described in another column of our present issue. Here in California, above all other places, where labor is high, our fields smooth, and the soil unusually productive, can stenni and horse-power be most advantageously substituted for human muscle and sinew. The introduction of machinery into farm labor is now almost universal in California; indeed, the farmer who would have his work done by hand, would here, by reason of the high prices of labor, fall rapidly behind his neighbor who takes advantage of the improved machinery of

NEW QUARTZ MILLS.—Among the new quartz mills ordered, in this city, within the past few days, we may enumerate a 40-stamp steam mill for the Gold Quarry Mining Co., of Attwood & Co., near Lincoln, and a first-class 30-stamp mill, with a 90-horse-power engine, for the Angels Quartz Mining Co., near Angels Camp, Calaveras county. Both these mills are in process of construction at the Union Foundry.

Peterson & Nickerson are building a 10-stamp mill, to be driven by a Jonval-Turbine wheel. Capt. G. D. Wadsworth is putting up a first-class 40-stamp steam mill, for a company whose name and location we have not learned. The machinery is to be delivered by railroad at Shingle Springs. J. H. Blood is erecting a pump and hoisting works, to be driven by steam, at his mines in Indian Valley. The iron work and castings for the three last named localities are being executed at the Miners' Foundry; which establishment has also just completed a fine cement crushing mill for the Oriental Mining Company, at Java Hill. This mill was to have been started the present week.

It would appear from the above that the construction of quartz mills has not yet ceased in California; neither is the supply of old mills, which have proved unfortunate in their location, sufficient to meet the demand for new localities. There are doubtless other orders for mills and mining machinery which have been given out to the various foundries in this city within the past few days, which have not come to our knowledge.

THE NEW PROCESS, as it has been called in some of the papers, by which the fifteen tons of rock was recently worked at the Pine Tree Mine, on the Mariposa estate, with, as is claimed, an extraordinary result as compared with the processes previously employed at that mill, is nothing more nor less than the "Ryerson Process," which was set up in this city and described in the MINING AND SCIENTIFIC PRESS some two years ago. We had intended to have alluded to this matter at considerable length in the present issue, but have been compelled to defer it till another time, probably next week. We have no doubt but that, with certain modifications, it might be made valuable, although it has failed in repeated instances in various parts of the State.

FOR SAVINO SULPHURTS.—Messrs. Goss & Lambard, of the Sacramento Iron Works, have recently furnished several of Hendy's Concentrators for the Golden Rule Mill, Tuolumne county, and the Enterprise Mill in Meadow Lake district, Nevada City.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Process for Treating Copper Ores.

EDITORS PRESS:—The greatest objection to the various methods of extracting copper from its ores by solution, is the great cost of iron for the precipitation, as a quantity is consumed nearly equal to the copper obtained. I have devised a process applicable to poor pyritous ores, of which there is an abundance in this country, by which this difficulty is obviated, and which, I think, possesses some other advantages over those in use. It is substantially as follows:

Crush the well cleaned ore through a screen of about thirty holes to the inch; roast in a reverberatory furnace, at a low heat, so as to produce the greatest possible quantity of sulphates; leach the roasted ore with solution of chloride of lime; the result will be a solution of chlorides of copper and iron, sulphate of lime remaining with the ore; oxide of copper will be dissolved by the action of the chloride of iron. The ore will probably still retain some copper; it must be re-roasted, this time dead, so as to convert all the copper present into oxide, and leached with the solution previously obtained, which must contain sufficient chloride of iron for the purpose. A deficiency of the latter may be remedied by means of common copperas treated with chloride of lime.

If well managed, a nearly pure solution of chloride of copper will be obtained, which must be treated with milk of lime, by which the copper will be precipitated as oxide, and the resulting solution of chloride of lime will be ready for another operation.

Variations of this process will readily suggest themselves. In some cases it may be best to roast the ore dead the first time, and treat it with chloride of iron procured from the sulphate by chloride of lime; or, after roasting dead, a quantity of crude pyrites may be added to the still hot ore, when sulphates will be formed in great abundance. If the sulphate of lime was marketable, it would be easy to obtain it separate from the ore. Poor ores of the oxides of copper should be mixed with pyrites and roasted, by which any calcareous matter will be converted into sulphate.

Where wood abounds close to the mine, I think ores of the class named might be economically worked in this way.

Since the above was written, I have seen, in "Lamborn's Treatise on the Metallurgy of Copper," an account of an almost precisely similar process, the invention of two Austrian chemists. The principal difference is, that the chloride of copper is formed in the furnace by means of salt. It is not stated that the chloride of lime is used to remove sulphuric acid (sulphate of soda), yet it must be so, or the oxide of copper would be obtained mixed with sulphate of lime. Thus, it would seem that my process has some advantage in not requiring the use of salt.

Should any one feel disposed to test this method, I shall be happy to give any further particulars in my power. DON CARLOS.

GLACIAL ACTION IN BEAR VALLEY.—The Nevada Gazette says that several observing gentlemen, who recently visited Bear Valley, near Henness Pass, discovered the most unmistakable indications of glacial action, going to show that that valley is the work of one of those huge plowshares of the Almighty by which He has wrought some of the most important topographical changes upon the earth's crust. This valley is between 4,000 and 5,000 feet above the level of the sea—the point at which, according to the theory of Agassiz, we may look for the most certain traces of glacial action.

PROPAGATING THE PEARL OYSTER.—A series of experiments are now being carried on by the Madras Government for the raising and propagating the pearl oyster. It is claimed that there is no more trouble in raising the pearl than the common oyster.

Amador County Mines.

BY OUR LADY CORRESPONDENT.

MESSRS. EDITORS:—Being a sojourner in this auriferous region and having completed my prospecting, I now take my leisure to draw conclusions from past observations. Troubled with neither "feet" nor "theories"—two mighty influences with men, warping their judgment and crowding truth aside—I consider my opinions valid. I have passed beyond the routine of female education and can translate the mining tongue, talk sulphuret and speculate upon *pay rock*. Wherever gold is visible it sticks to my fingers—the same affinity between flesh and blood and the precious metals, has made many men eminent. With these attributes I present myself as your "occasional," though not your "own" correspondent.

I know of no better stand-point than Jackson, "the seat of government" for Amador county, from which to behold Nature's handiwork in the line of "gold and gems;" and though the poet has said they do not satisfy the heart, I am sure they hold with tenacity the other two strands of strength possessed by the miner—head and hands! I have read of chalcidony, opals and rubies scattered over the face of nature; but I never thought so many were piled into one hill as they have at Mokelumne Hill! I shall have occasion to speak further of the opal mines before I close my letter.

The town of Jackson is situated almost directly over the great *Vetere Madre*, or Mother Lode of the auriferous belt of slates that skirt the western base of the Sierra Nevada for more than fifty miles. On this lode are situated the works of several mining companies, whose startling success has lately given new and higher life to California gold quartz mining. "All the world" knows about Haywood's mine—which has made a millionaire of its owner—at Sutter Village, four miles north of Jackson. Midway between these points is the Oacida mine, with a mill of forty stamps, and ore enough to keep them all busy. The Austrian mine is only one mile north, and though not fairly opened, is supposed to rank high in the category of rich claims. The renowned Coney Lode is in the edge of the town, and though the rock all pays handsomely, they recently struck an immense pocket, the value of which I have not ascertained. It is astonishing how Dame Nature allows her pets to poke their picks into her *pockets* whenever they can find one in the *seams* of her outer garments, and many a son of toil has found the pot of gold without going to the end of the rainbow! These are some of the prominent, but do not include a tithe of the mines here.

What student of Nature and Nature's laws can conscientiously sing—

"Above, below, where'er I gaze,
Thy guiding finger, Lord, I view!"

In a small hotel in an interior town, in the middle of August? Beside, what practical miner is content to remain on his oars (*ores*) before examining everything within his reach? So we thought, one morning, as the sun arose and the earth seemed a furnace to which the heat was being applied. Our thoughts winged off to "primeval forests," where cool springs gush from granite rocks, and the din of industry irreverently breaks in upon the solemn stillness of the ancient mountains. So we commenced to journey, bodily, where our thoughts had been, eighteen miles distant in an easterly direction, over rough roads, past fertile fields, to a point three miles from Volcano, where Meader & Ambler have purchased a mine, among the granite rocks and pine trees—those symbols of strength and energy—built a mill, made roads and erected dwellings. The latter gentleman applies his own inventions to his mining enterprises. In all respects it looks as though they meant to make the most of the three score years and ten allotted to them, and we trust Heaven will grant them a lease of a few more years for happy reflection! The mill is of five stamps, driven by water, which is supplied from the South Fork of Sutter Creek. The vein is two miles from

the mill, composed of sulphurets encased in granite walls, and yields from \$150 to \$300 per ton. The sulphurets are oxidized with the aid of chemicals in two weeks, and they claim to get all but two per cent. of the gold. Their grinders differ from others in this respect—they discharge as they grind.

Volcano is another place where the student of geology and mineralogy can fill his pockets with specimens worthy of his cabinet—such as geodes, asbestos and serpentine. The first is a round stone, containing a cavity filled with crystals or clustered nodules of silicious matter. The second, asbestos, has fibers which were woven into cloth by the ancients, which the good housewife never had to wash on Monday—the process of cleansing being simply to throw the clothes into the fire; being non-combustible, fire had no other effect than to purify. The third, serpentine, is hydrous silicate of magnesia, usually shaded with chromic iron.

The opal mine at Mokelumne Hill is certainly an object of scientific interest. The opals are found imbedded in a stratum nearly horizontal toward the summit of a ridge of volcanic matter, known as Stockton Hill. The stratum is from one inch to six inches in width. It consists of yellowish ferruginous, scoriaceous matter, crumbling before the pick like dried clay. In this is imbedded roundish nodules, covered with a chalk-like concretion, which, when broken, exhibit the chatoyant light of the opal. They vary in weight from a few grains to two or three ounces each. A miner, with little labor, can extract one thousand per day. Of this number, ten per cent., the proprietors say, will probably be good gems. The stratum has been opened at six different points. Three or four tunnels have been run into the hill a distance of from fifty to one hundred feet each. Wherever a moist spot is encountered the stones are worthless, being soft and friable, and almost wholly converted into chalk-like matter. Several varieties of stones are found, as precious opal, fire opal, the common milky opal, menolite, etc. The mine is claimed and worked by a company consisting mostly of Frenchmen. I was informed they had sent 25,000 stones to the city of Munich, 5,000 to Paris, and 1,000 to New York, to test their value in the gem market.

While on the subject of gems, I will mention the fact of diamonds having been found at Volcano, a distance of but a few miles from the opal deposits. A fine deposit of chalcidony is found on the opposite side of Mokelumne Hill.

Jackson, August 23, 1866.

THE LAMPHEAR AND McDONALD MINE.—A correspondent from Mokelumne Hill, furnishes us with a lengthy communication with regard to the above-named mine, which we are obliged to condense, as follows: The mine is located at the head of Spring Gulch, a tributary of Chile Gulch, one mile southeast of Mokelumne Hill. It was originally located by Mr. McDonald and others, who subsequently added to the company Mr. Lamphear, for the purpose of procuring funds to open the mine. An incline was sunk to the depth of sixty feet, an arastra with a 50-foot water wheel, and hoisting works, were put up and 100 tons of rock crushed, which yielded \$15 to the ton, but did not pay expenses; 500 tons more rock, taken out and crushed at a neighboring cement stamp mill, 200 tons of which were first put through, yielding \$5.50 per ton. Another lot of 100 tons yielded \$10 per ton. This, though not up to the mark, gave better satisfaction; but another lot of 200 tons was crushed, yielding \$6.10. Operations were thereupon suspended, although the company have the fullest confidence in the value of their mine. With such results as given above, from a mill constructed for working cement only, it appears to us the company ought to feel sufficiently encouraged to go on and erect a class of machinery proper for the work they have in hand.

HEALTHFUL EFFECTS OF GREAT FIRES.—It is stated as a singular effect of the late Portland fire, that while previous to it several burials a day took place from one of the most unhealthy wards in the city, none have occurred since the conflagration, from that locality. There would be nothing very singular in the above, if the "unhealthy ward" was one situated in the midst of the "burial district."

PITCH AND ROSIN.—The shipments of these articles from Oroville average about fifty tons per month.

[Written for the Mining and Scientific Press.]

From Sierra County.

BY AN INDEPENDENT CONTRIBUTOR.

[Continued from page 139.]

EDITORS PRESS:—From the summit of the divide, looking in a northerly direction, the Downieville Buttes are seen with their pinacled and towering peaks, apparently within a stone's throw, but, in reality, some three miles distant, "as the bird flies," the deep yawning gulf of the gorge of the South Fork of the North Fork of the Yuba River intervening; but as we do not happen to be of the feathered tribe, but of the *genus homo*, we are forced to follow the winding sinuosities of a mountain trail down its steep banks for some three miles to the river, which we forded, and on its northerly bank struck "the Yuba Gap Wagon Road," which, to the disgrace of Sierra county, is yet in an unfinished state, owing, as I understand, to petty jealousies existing between the northern and southern portions of the county—(this is an important enterprise, and has served materially to retard the developments of its mineral resources). Following up the northerly banks of the river, in an easterly direction, through a "city" of half a dozen scattering houses (Sierra City), and past the Downieville Buttes (which, from its interesting character as a mineral district, I will leave for special note), we reach the eastern boundary of the schistose formation, at its junction with the igneous belt, consisting of granites, porphyries, traps, etc., etc., which form a powerful belt from ten to twelve miles in width, and traceable, longitudinally, for the entire distance of the Sierra range. The formations here we find highly mineralized, the veins powerful, and, as a rule, cutting the stratification, denoting true fissures. Here the Yuba forks again. Following its northerly branch, the formation is found to alternate from a feldspathic granite to porphyritic, and by imperceptible change to anygdaloidal traps, basalts, and a dark colored, highly crystallized, hornblende trap, which for some three miles show no indication of containing metalliferous veins, although at other points metalliferous concentrations are likely to occur. At a point near Howard's ranch I notice the formations change, and feldspathic granite again intervenes, elvan courses are frequent and bold, subordinate to the main granitic masses, metalliferous quartz veins are more abundant, cutting the stratifications, the debris of which gives evidence of considerable richness in gold, and the veins are highly mineralized.

A noticeable feature in this formation is that the various ores of copper have replaced the iron ores, which are invariably found accompanying the auriferous veins found in the metamorphosed schists, adjoining the igneous rocks. Rare ores of molybdenum also occur, while iron is seldom seen. Two miles from Howard's ranch, in a southerly direction, parallel with the formation, and in a constantly occurring and increasing cupriferous indications, denoting a concentration of copper deposits, we find

THE SIERRA BUTTES COPPER MINE,

A recent discovery, which gives promise of proving to be a vein of considerable value, indicated in the croppings by a broad band of goosana, a mixture of quartzose matter, and an insoluble hydrated oxide of iron, with free gold, the copper having passed off by the action of water in the form of a sulphate. This goosana does not extend to any considerable depth, the ores being remarkably free from iron in this combination; the pyrites, with associate ores, are found undecomposed but a short distance below the croppings.

This lode, from its strong resemblance, in mineralogical and geological features, to the cupriferous veins, worked in the vicinity of Copiapo, Chili, which have yielded munificently for years, and are still reliable properties, is worthy of more than a passing note, and as it promises to be the pioneer of an entirely new and interesting cupriferous region, I will defer a more detailed description until my next.

August 30, 1866.

VIAJADOR.

Mechanical.

FORCE OF FALLING WATER.—The power communicated to water by falling from a great height is illustrated at Orinson, in France. A turbine used by a flour mill in that locality, is supplied by water which passes through an opening only six-tenths of an inch wide and about three-tenths high, but it has a vertical pressure due to a height of more than 354 feet, and a velocity, in consequence, of 151 feet per second. It escapes with a hissing noise that can be heard at a considerable distance, and causes the turbine, which moves on a horizontal axis, to make from 300 to 350 revolutions per minute.

AMERICAN MILITARY INVENTIONS.—Russia takes a very great interest in the improvements in military science lately made in this country, and has sent an officer of the Royal Russian Mining Engineers—Capt. Kholostoff by name—on a tour of inspection throughout the United States, with instructions to make monthly reports to the Home Government. He has visited the armory at Rock Island, Illinois, and lately witnessed the casting of the 20-inch gun for the Paritan, at Pittsburgh. At present he is in St. Louis, and it is said has arranged with the inventor of the Rodman gun to furnish some of that kind of artillery to the Russian government.

WATER SHOES.—A Norwegian, who is acting as hagrage-master on the Hudson River Railroad, N. Y., offers to go against any boat which may be produced, for five or ten miles, and for a sum of from \$5,000 to \$6,000. He will use what he denominates "water shoes," each shoe twelve feet in length and about six inches in width. In each shoe is an opening of about the size and shape of his foot, and both shoes are fastened together at a proper distance apart, and both sitting on the surface, drawing scarcely an eighth of an inch of water, being perfectly air-tight. He will stand up in these shoes, and, using a paddle, striking the water, first on one side then on the other, will go through the contest. He is confident that with this contrivance he can beat any four-naired crew in the United States.

OIL STONE.—The recent discovery of a very good quality of oil stone, by Charles H. Eaton and William C. Holmes, near the Merced river, between Horse Bend and Don Pedro Bar, is attracting a good deal of attention. Barbers and others competent to judge say that the stone is superior to any other kind now in use. Since the first discovery, the mine or quarry has been opened and found to be very extensive. The material used for "oil stones" is a variety of slate.

WHEELS OF RAILWAY CARRIAGES.—A very important improvement in the wheels of railway carriages has been invented, which consists in giving a free motion to the axle independently of the carriage and the wheels. In this wheel the axle is not fixed, but is free to rotate independently of the wheel as of the carriage. The entire absence of retardation by the *biting* of the axle, and any amount of friction is dispensed with.

THE DEAD STROKE POWER HAMMER.—One of these hammers, of sixty pounds weight, with 12-inch stroke, gives a blow equal to 20,000 pounds, and, it is said, is capable of forging down cast steel from three inch, or wrought iron from four and a half inch square. This hammer was patented in February last.

TENACITY OF BOILER PLATES.—The tenacity of good wrought iron boiler plates has been stated at 51,000 pounds per square inch. That of a double-riveted joint, per square inch of the iron left between the rivet holes, is the same; that of a single riveted joint, somewhat less, as the tension is not uniformly distributed.

CIRCULAR HORSE POWERS.—In working a horse power, the animal works less advantageously than in drawing a carriage along a straight track. Experiments have proven that the best possible results may be realized with a horse power, when the diameter of the circular track in which the horse walks is less than about forty feet.

NEW METHOD OF OBTAINING AND APPLYING STEAM POWER.—An invention relating to a novel method of applying the motive power of steam to the various useful purposes to which such power is or may be applicable, has been patented by Messrs. W. T. Cole and H. S. Swift, of London. According to the ordinary method of using the force of steam, the well-known cylinder and piston are employed, the action being reciprocating and being converted into rotary motion by the agency of the crank; but according to this invention both cylinder and piston are dispensed with, and a direct rotary motion is obtained from the power or pressure of steam. "We propose," say the patentees, "to set on suitable foundations and standards a hollow shaft in communication with a boiler; this shaft is a fixture, but it is continued to a fly-wheel by a second hollow shaft, secured to the former one by means of a steam-tight stuffing-box. This second shaft, therefore, is capable of revolving round the fixed shaft. Now at the extremity of the moving shaft we propose to place a fly-wheel, the spokes and periphery of which may be made hollow; such spokes or tubes being in continuation with the shaft in order that the steam may traverse them. The spokes, tubes or periphery of the fly-wheel are terminated by tubular outlets set at right angles to the radii of the wheel. Each of these openings or outlets is provided with a throttle valve, consisting of iron plates and india rubber, in order to throttle the exhaust ports and decrease the area of the escape of steam. These valves are controlled by means of a hand-lever in connection with a sliding ring on the shaft, such ring pushing (nearer to or farther from the fly-wheel) a second sliding ring held by clutches so as to turn with the shaft. The latter ring is connected to toggled arms joined to the valves; it, therefore, follows that as the ring is moved the toggled joints will compress or open the valves as required. The fly-wheel is to be enclosed in a cylindrical steam-tight chamber, in connection with a condenser or steam-pipe, and the steam-shaft and driving-shaft are to pass through the chamber by means of stuffing boxes. The steam issuing from the periphery of the fly-wheel or from the tubes causes a reaction upon the interior thereof, and thus a direct rotary motion is effected from the fly-wheel itself, thus expending the power at the greatest leverage or furthest from the center of the shaft, which is the center of motion."

NEW MODE FOR GENERATING STEAM.—Letters patent have been granted to Mr. Matthew P. W. Boulton, of Tew Park, Oxfordshire, Eng., for "improvements in generating steam and heating steam and aeriform fluids." Steam passing from a boiler is superheated, and the superheated steam is caused to pass through the water in the boiler, such a force being applied to it by means of a propeller or forcing apparatus as is requisite to force it through the water. The heated steam rising through the water generates steam. The heated steam may be caused to rise through the water in numerous small streams, it may pass through the interstices of movable bodies, such as balls, which may float or may be suspended in the water, or may find their own position by weight, it may pass through narrow passages. To prevent these passages from being choked by deposit, they may be kept clear by a tooth or piece moved through the passage by the engine, either by a rectilinear or circular movement. The steam may be caused to rise through the water in the boiler in a zigzag course by means of plates or bodies suitably disposed. A portion of the heated steam may be forced through the water, while a portion of it is caused to mix with the steam above the water, in which steam are suspended particles of water in a state of spray or minute division. The heated steam mixing with this watery steam converts the particles of water held by it in suspension into steam. Again, the heated steam may be caused to pass over the surface of the water in the boiler, so as to come in contact with a large portion of this surface, communicating heat to the water and generating steam in this way. These and other different methods may be combined in various manners.

IRON VS. WOODEN SLEEPERS FOR RAILROADS.—The Madras Railway company have been experimenting on the relative costs of wood and iron for railway sleepers. It has been found that for a series of years the wooden sleepers have averaged a cost of \$169 per mile, while the iron ones have cost but \$74 per mile. The advantage of iron over wood has been made so apparent, that the company has resolved to use iron hereafter altogether.

BOILER INCrustATIONS.—It is said that finely pulverized clay, diffused throughout the water in boilers, has a tendency to put a stop to incrustations. The clay particles prevent the consolidation of deposits, which assume a muddy form, easy to remove.

Scientific Miscellany.

THE MISSISSIPPI DRYING UP.—As improbable and alarming as the announcement may appear, it is nevertheless asserted, and believed by both practical and scientific men, that the "Father of Waters," is rapidly diminishing in volume, by reason of the country about its tributaries being settled and denuded of its forest covering, which has hitherto prevented the great excess of evaporation which is now occurring. Navigation is already obstructed to some extent by sand bars in places where they were formerly unknown. The "June rise" has now almost entirely disappeared. Such an occurrence forty years ago would have been looked upon as a terrible calamity in prospect; but in these days of railroads and steam engines, the loss of a river, except for purposes of irrigation, is a matter of but little national consequence. The time will eventually come, when the produce of the "Great Northwest" must find its way to the Atlantic seaboard by rail, instead of to New Orleans by steamboat.

INSTRUMENT FOR MEASURING ACTION OF THE HEART.—Two years ago, M. Marey, known to experimental physiologists for his dynamometer to elucidate the mechanical and physical character of the circulation, invented an instrument called the sphygmograph, to register the form of the movement in the blood of the arteries. Recently this instrument has been found to be very useful and trustworthy in indicating variations in circulation dependent on disease. It has been applied to detect diseases of the heart, which it does by registering the pulse trace characteristic of each disease. Hitherto morbid changes in the great arteries, aneurisms, etc., have baffled the skill of physicians to detect and define, but they can be discovered by means of the sphygmograph, by the modification they induce in the characters of pulsation.

MINUTENESS OF SPECTRUM ANALYSIS.—It is well known to all who have paid attention to the new method of "spectrum analysis" that bodies, in order to be treated by this process are usually burned, or brought to incandescent vapor, in order to give their characteristic spectra; but this is not true of all bodies. So minute is this process that one-fourth of a single red globule of blood, containing iron, will give its characteristic spectra, seen by the micro-spectroscope, without burning. One of the discoveries of spectrum analysis claims to detect the 1-800,000 of a grain of sodium in a state of vapor, but the amount of iron in this 16-1,000 of an inch fraction of a blood globule, must really be far less than that, yet its characteristics are very distinct in the micro-spectroscope. Indeed the microscope as far transcends the ordinary means of spectrum analysis as it does unaided vision.

AGASSIZ, who has recently returned from his exploring expedition to Brazil, has been absent a little over one year, during which time he has made many important discoveries in geology and natural history, finding abundant evidence to establish his favorite theory of glacial action, and adding to the classifications of the animal kingdom several hundred specimens hitherto unknown or undescribed. He will at once begin the preparation of a scientific memoir, embracing the results of his investigations, and a work of popular character from his pen, entitled "Travels in Brazil," is already announced by Ticknor & Fields for publication in the fall.

FOR PRESERVING HAY.—It would be a desirable thing for the farmer if he could preserve, at least a portion of his grass green instead of curing it by a drying process. A method of accomplishing this purpose has been suggested as follows: Dig a cellar and build within it a chamber to hold grass. Fill the space around the outside with snow during the winter, and in the summer when you cut your grass, place it immediately within the refrigerated chamber. It is calculated that it will be preserved on the same principle that fruits are thus kept in refrigerating houses. We are not aware, however, that the experiment has been tried.

THE ORIGIN OF IRON ORES.—At a late meeting of the Manchester (Eng.) Geological Society, the President stated that some years ago he wrote a paper on the origin of iron ores of Furness. He previously went to look at the district, and found the iron lying in holes in the limestone. The great deposit of Lindale Moor, which had been worked, he believed, for centuries, was really a valley excavated out of the limestone, and then filled with iron ore. As to the age of the ore, his own opinion was that it was since the deposition of the limestone, and before the formation of the Permian rocks above it. The holes might have been formed either by waters charged with carbonic acid—or washed out by the sea. Some years since, Mr. Bolton, a gentleman living near Ulverstone, showed him a remarkable fossil, which seemed to mark the age of these beds of hematite iron ore, and which caused him to believe that they were all formed during the deposition of our coal measures. His reason for dating the age at which these beds occurred arose from the fossil which Mr. Bolton showed him—a good *Sigillaria vascularis*, displaying good internal structure and external characters, all of which had been converted into peroxide of iron. Every portion was preserved in this peroxide of iron. No doubt that plant grew during the carboniferous epoch, and was afterwards converted into peroxide of iron. The origin of iron ores was now generally attributed to volcanoes. Some years ago a rich bed of hematite ore was found in the neighborhood of Mt. Vesuvius. It came out of the volcano as a chloride of iron, and was immediately converted into a peroxide of iron. The generally received opinion now was that erosions had been made in the limestone during the carboniferous epoch, and afterwards filled with iron before the Permian sandstones had been deposited over it.

INDIAN INK.—Indian ink is a black pigment brought from China and Japan, which, on being rubbed with water, dissolves, and forms a substance resembling ink, but of consistency well adapted for working with a camel hair or sable pencil, on which it is much used as a color in miniature painting, and in all drawings in *chiaro oscuro*, or where the effect is produced from light and shade only. The preparation of Indian ink, as well as compositions used by the Chinese in painting, is not based on any reliable authority, being shrouded in any considerable quantity of "trade haze and secret fog." The composition appears by experiment to be the coal of fish-bones, or some vegetable substance mixed with isinglass size, or other size in conjunction with honey or sugar, to prevent its cracking. A good Indian ink may be made from the fine soot from the flame of a lamp or candle, received and collected by holding a plate over it. Mix this with the size of parchment, and it will be found to give a good deep color. Burnt rice has been considered by some a principal ingredient in the genuine Indian ink, with the addition of perfumes or other substances not essential to its qualities as an ink.

ORIGIN OF THE DIAMOND.—M. de Chancourtois, in a recent paper to the French Academy, says that the diamond is derived from hydro-carbureted emanations, just as sulphur is derived from hydrosulphureted ones. He contends that the diamond is separated by the rapid combustion of a carbureted hydrogen, the carbon of which is only partly oxidized with the whole of the hydrogen, while the remainder of the carbon that has escaped oxidation is deposited in crystals, that is, in the state of diamond.

A scientific way of lighting pipes and cigars has been devised in Paris. It consists of a chemically prepared powder, which may be kept in a small tin can with a narrow orifice. A small quantity of this powder placed upon the cigar and then breathed upon, will instantly take fire.

The microscope reveals the fact that a little black speck of potato rot the size of a pin head contains about two hundred ferocious animals of the beetle form and shape, biting and clawing each other most savagely.

THE DIAMONDS EXCEED.—The crystallized protoxide of copper, recently found in crystals, transparent to red light, in Chessy (Rhône), far exceeds in refractory power the diamond. H. M. Fizeau has recently shown that both expand under heat.

EFFECT OF THE PERFUME OF FLOWERS.—The presence of the perfume of lavender in the air increases its power of absorption of heat sixty times, and anise seed 372 times; hence the perfume arising from a bed of flowers increases the temperature of the air around them.

It is said that a little island has been discovered in a supposed sea in the plateau Mare.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, Sept. 8th, 1866.

Monetary affairs continue to exhibit the same features noted for some time past. A good demand prevails for legitimate purposes, but the supply of capital is abundant and acceptable paper is readily taken in Bank at 1@1½ cent per month, with occasional transactions at 1½ cent.

The San Francisco Assaying and Refining Works are again in active operation, all the required improvements having been made to their melting and refining establishment on Brannan street.

The United States Sub-Treasurer, in this city, has sent East for Government account, since January last, \$8,000,000—which figures are not embraced in the specie exports on mercantile account.

The financial affairs in London continue to improve, and late telegraphic advices state that the Bank of England has reduced its rate of discount to 5 cent per annum.

The receipts of treasure from domestic sources have amounted to about \$1,000,000 since the first instant. The yield of the silver mines of Nevada, as well as that of the quartz mines of this State, show no abatement.

There is very little demand for bullion for shipping purposes, the market being well supplied with both gold and silver bars. The former are offered at 830@840, and silver bars are selling at about 2 cent discount.

Currency bills on the Atlantic cities are offered at 40 cent premium on gold. Sight Drafts, payable in gold, are worth about 2½ cent premium, and Telegraphic Transfers are made at 5½ cent premium. Sterling Exchange ranges from 48½ to 49d. for best bankers' bills.

Legal Tenders are dull and inactive this week, and small sales were made at 72 and 72½ cents—closing yesterday at 72½. Our latest telegraphic advices from New York quote Gold at 146, and Sterling at 106 nominal.

The Mining Share Market, during the past week, has manifested considerable activity, and several leading stocks were dealt in to a considerable extent. The tendency of quotations is upward, and most shares are now selling at enhanced rates from prices ruling early in the week.

City Stocks have been in more request the past week than for some time past, insurance shares taking the lead. Pacific Insurance sold at \$182 per share; National, at \$77½@77¾, and Union at \$125. Merchants' Mutual Marine is held at \$300 under the change to \$500 to incorporate share, of which 60 cent is now paid up. One hundred shares of the North Beach and Mission Railroad Company, sold at \$45 per share. Spring Valley Water Company is now held at \$64. This Company have declared a dividend of ½ cent per month on the capital stock payable on and after Monday next, the 10th inst. California Steam Navigation Company was sold at 75 cent.

Hale & Norcross is still firmly held, and no sales transpired in the Board the past week. It is now quoted at \$1,650 bid, \$1,750 asked. Various portions of the mine are looking exceedingly well, but no new developments have been made recently.

Savage steadily advanced from \$1,075, to \$1,130, b 30, receded to \$1,115, then sold at \$1,135, closing yesterday at \$1,160 bid. During

the week ending Sept. 1st, 1,011 tons of ore were extracted, and 931 tons shipped to mills; leaving 626 tons on hand. The approximate value of the above 1,011 tons is estimated at \$45,145, cost of extraction \$8,736, and reduction \$23,414; leaving an estimated profit of \$23,014. For the month of August the actual profits of the mine are stated to be about \$100,000. In making the above estimate 2d-class ore is valued at \$55 per ton, and 3d-class at \$35. The south drift, in the Curtis shaft, is penetrating unprofitable spots of ore. The Superintendent's report says, "the ground is hard both with us and the Hale & Norcross, so that it will probably take three weeks to connect." The Atchison Mill now reduces about 45 tons of ore per day.

Crown Point has receded from our last quotations, and a few feet changed hands at \$900 and \$880, closing yesterday at \$880. For the week ending Sept. 2d, 605 tons of ore were extracted from the mine. The drift south, on the 300-foot level, and the north, middle, and south winzes, are looking well. The drift from the 400-foot station is now in 213 feet, still leaving 200 feet to penetrate before striking the vein. The suit of the Kentucky vs. this Company has been settled for the sum of \$20,000.

Gould & Curry has met small sales the past week, and at the close is held at \$710 per foot. The official figures give the receipts of bullion for the month of August at \$134,395 23. The incline from the 2d to the 4th station has not yet been completed, and not until then will a thorough search be instituted to ascertain the quantity of ore in the rich seam lately passed through.

Yellow Jacket has been more actively dealt in since our last report, over 200 feet changing hands, advancing from \$772½ to \$790, receding to \$775, rallied again to \$790, then sold at \$749@757½, closing yesterday at \$770. In the absence of official reports, a telegram, dated September 3d, says: "Mined 9,300 tons last month; gross yield, \$390,000." This is for the entire month of August, and gives an average of a fraction less than \$42 per ton. This, it is thought, will leave a net profit of nearly \$20 per ton.

Ophir has met with a slight decline, opening at \$210, receding to \$187, then advancing to \$195, and closed yesterday at \$210, b 30. A contract has been let by this Company to sink the shaft to a further depth of 100 feet, in order to get at the body of ore below the 9th level, opened by means of a winze. In the 7th level a body of ore has been found which promises well—1st-class paying, it is thought, \$200 and the 2d-class \$70 per ton. There are about 700 tons of ore now at the Company's Washoe works and mine, which, it is believed, will yield about \$70,000 in bullion. The working expenses of the mine, heretofore quite heavy, have been very materially reduced, and the receipts for the month of September will be larger than usual.

Chollar-Potosi has exhibited considerable animation the past week, and some 200 feet were sold; opening at \$130, s 60, advancing to \$135, then dropping to \$130, again selling at \$135, and closing yesterday at \$136. During the week ending September 1st, 478½ tons of ore were shipped to Custom Mills. The several stations of the mine present no new features requiring special mention. We have it from a reliable source that no assessment is thought of at present, as rumor would have it last week.

Imperial has advanced a trifle, selling early in the week at \$96, advancing to \$100, and closing at \$96 bid.

Belcher changed hands at \$115@127, then sold at \$125, closing at \$120. Confidence has commanded better figures, gradually rising from 46 (s 30) to \$56, and selling yesterday at \$59. Overman has changed hands to a large extent, improving somewhat from previous quotations, selling within a range of \$11¼@14½ the past week, and closing at \$14¼. Bullion met with small sales at \$29@25, and closed at \$23. Sierra Nevada rose from \$2½ to \$6¾; Daney was sold at \$4½; De Soto at \$3@3¼, and Exchequer at \$2@1¼ per share.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday, amounted to \$361,135.

COTTON STALKS FOR HEMP.—It has recently been discovered that every 120 pounds of cotton stalks, when properly dressed, will yield forty pounds of thread, as good as flax for making bagging and other coarse fabrics. A large company has been organized in one of the Southern States to turn this discovery to practical account. Now if some lucky inventor will discover a way to reduce this material to pulp for paper-making, he will not only secure a fortune for himself, but do an important service to the world.

GEORGE A. MITCHELL, the inventor of the "copper tip" for children's shoes, was recently drowned near his own home, in attempting to save his son from a like fate. Both father and son found a watery grave. Mr. Mitchell had acquired a large fortune from his invention.

THE DESERT IN BLOOM.—It appears as though the arid Desert of Sahara would soon be made to bud and bloom under the scientific management of French Engineers. Five deep artesian wells have been sunk as an experiment, and the ground around them is already clad with verdure from their life-giving waters. It is said that fish have come up from this mysterious source of water beneath that parched crust of the earth.

EFFECTS OF TRANSPLANTING.—It is stated that by transplanting flowering plants several times a year for two successive years, without allowing them to bloom, they can be made to produce double blossoms, while the plant only previously gave single ones.

ORANGE TREES, literally loaded with fruit, are growing at Bidwell's Bar, in Butte county. One tree is estimated to have at least 2,000 oranges growing upon it. This fruit ripens to perfection in that locality. There are numerous other sheltered places in central California where this fruit will ripen in the open air.

GOLD YIELD IN AUSTRALIA.—Notwithstanding an extraordinary drought, and consequent scarcity of water for mining purposes, the productiveness of the Australian gold fields does not appear to have been checked. The reports from many of the companies show but little falling off. The Custom House returns of the export of gold since the beginning of this year, up to the latest date, give 1,648,693 ounces. The quantity exported last year was 1,725,000 ounces, in the like period.

EACH of us bears within himself a world unknown to his fellow-beings, and each may relate to himself a history resembling that of every one, yet like that of no one.

YOUNG MEN WANTED!

Pacific Business College!

751 Market street, between Third and Fourth, SAN FRANCISCO.

AN INSTITUTION DESIGNED TO PREPARE YOUNG and middle-aged men for an active and successful business life.

BOOK-KEEPING, PENMANSHIP, COMMERCIAL LAW, COMMERCIAL ARITHMETIC, CORRESPONDENCE, MODERN LANGUAGES, ETC.,

Practically taught.

This College forms a link of the

American Chain of Commercial Colleges, Located in the principal cities of the United States, and is the only institution on the Pacific coast conducted on actual BUSINESS PRINCIPLES.

Regular Banks and Business Offices have been introduced.

By which we are enabled to fit out Students in the BEST POSSIBLE MANNER, and at the LEAST EXPENSE of time and money, for the practical duties of the Counting House.

Students can enter at any time of the year, there being no vacations. Each student receives individual instruction, with the exception of Lectures and other general exercises.

The College Review.

Owing full particulars of the College, can be had FREE, by calling at the College, or addressing

E. F. HEALD, President Business College, San Francisco.

SANTA CLARA COLLEGE, S. J., SANTA CLARA, CAL. Conducted by the Fathers of the Society of Jesus.

The SIXTEENTH ANNUAL SESSION of this College will commence on

Monday, August 20th, 1886.

TERMS—Tuition in the Classical and Scientific Department; Boarding and Lodging; Washing and Mending of articles washed; School Stationery; Medical Attendance and Medicine; fuel, light, baths, etc., per session of ten months. \$350. For further information and catalogue, apply to the President of the College, or to Rev. A. Maraschi, St. Ignace College, Market street, San Francisco.

REV. A. MARASCHI, S. J., President.

VALUABLE MINES! FOR SALE IN NEVADA COUNTY.

FOUR VALUABLE QUARTZ MINES, SITUATED AT THE base of Deer Mountain, and about equidistant from Grass Valley and Nevada City, are now offered for sale. These lodes run parallel with each other, are wide and well defined, varying from fifteen inches to four feet in width, and have been sufficiently developed to prove them to be of great prospective value. One of them is an extension of the famous Star Spangled Banner. A shaft has been sunk on the extension to a depth of thirty feet, where the lode is fully two feet wide, and prospects quite as well as the Banner did at that depth. On account of water, further progress downward was impossible without machinery. These claims are accessible at all seasons of the year, and wood and water exist in their immediate vicinity in great abundance. Parties who would prefer putting up machinery and sinking on one or more of these claims, for an interest in them, can do so, and liberal terms will be granted by the present owners. Persons desiring to purchase claims, or erect machinery to prospect the same, will find this a capital chance. For further information, reference may be had on application to the Editors and Publishers of the MINING AND SCIENTIFIC PRESS, 505 C Street, San Francisco. 2v12

By EXPRESS.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co.'s tariff) on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must themselves settle the same.

FIRST PREMIUMS!

DEWEY & CO.,
BOOK AND JOB PRINTERS,
PUBLISHERS OF THE
MINING AND SCIENTIFIC PRESS,
505 Clay street, San Francisco.

Preparing for Publication.
A complete History and Directory of the
Central Mines of Colorado.
And the towns and cities in their vicinity.

PERCEIVING THE GREAT ADVANTAGE TO COLORADO a pamphlet, historical and descriptive of its central and most important mines would be at the present time, the subscriber has undertaken to publish such a work. It is designed to fix for the future the discovery and early history of the mines, to sketch their progress and present condition, to give such statistics as are attainable with regard to their production, actual and possible; in fine, to disseminate throughout the East and in Europe accurate information respecting them. To relieve the tedium of such a work, interesting incidents illustrating the early manners and customs of the pioneers, and the gradual organizing into its present condition of the first and always to be the eminently Rocky Mountain State, will be given.

It is also designed to contain a complete Directory of the towns of Central, Black Hawk, Nevada, Golden City, Idaho, Empire, Georgetown, Gold Dirt, and South Boulder; views of each of those places; separate views of the principal buildings, public and private; also views of mills, ammines and of mountain scenery.

There will also be attached a Business Department, in which a limited number of advertisements will be in.

O. J. Hollister, of the Black Hawk Mining Journal, has been engaged to compile the body of the work—the historical and descriptive narrative. Having been here uninterruptedly for the past six years, and mingled freely in perhaps every walk of life, he trusts he will be able to do the subject ample justice.

All old residents of this region who are familiar with the discovery and early history of the mines, or with interesting incidents of that indefinite time known as the "early day," will confer a favor on the subscriber by furnishing such information to O. J. Hollister, Journal office, Black Hawk, Colorado.

The work will be issued sometime during the month of August. Price \$2, bound in paper; in muslin, \$2.50.

Address, G. M. BINKLEY,
May 10th, 1888. Central City, C. T.

Companies

Elegantly printed, with care and dispatch, at the office of the
Mining and Scientific Press.

Orders from the interior faithfully attended to.

Mining Summary.

CALIFORNIA.

Alpine County—

The *Miner* of Sept. 1st, has these items: The Mowyer tunnel is to be run from this ore until the ledge is cut, with an increased force. Water is now coming in at the face, and the sound of water ahead gives hope that the lode is near at hand.... An additional force was this week put to the work of getting out and assorting ore from the Morning Star.... The furnaces for the Davidson mill are well under way, the superstructure and furnaces proper being finished and the main flue or chimney more than half completed. The height of the whole will be forty-eight feet, and it is being built in the best manner.... The ledge of the Washington is understood to be improving in size and quality. The Mountain tunnel is being pushed ahead. The Lady Elgin company, owning on the Kohinour lode, are about letting a contract for seventy-five feet of tunnel. The Silver Mountain Buckeye No. 2, Maine and Pennsylvania companies, are at work with usual progress.

Amador County—

From the *Ledger* of Sept. 1st, we clip the following: The owners of the Anaconda, at Pine Grove, resumed work some two weeks since, and found rich ore from the beginning in the lower south drift. It has grown richer daily. We are informed that the mine is for sale.... The Coney & Bigelow mill, at this place, now under the management of C. T. Meader & Co., has been refitted with Mr. Amherst's concentrators, amalgamators, etc., and is again running. Everything about this mill seems like earnest work.

Same paper has an editorial again urging the point that a few hundred dollars expended in developing a mine, is almost sure to give one a property of many thousands.

Butte County—

The *Appeal* of 2d inst. says: We saw yesterday a very fine specimen rock from the Sherman ledge, at Cherokee, three miles from Oroville. We had seen other specimens from this ledge, and our confidence in its richness, after looking at this last, is greatly increased. The owners, Messrs. Binney, Kimball, and others, have a small prospecting mill on the ledge, and feel greatly encouraged.

Calaveras County—

The *Courier* of 1st of September says: The Gold Hunter, in which such a very rich strike was made last week, is under process of thorough development, being worked night and day. We have conversed with reliable persons who have facilities for being thoroughly posted in the mine, and the deduction is that the reports are correct, and that the Gold Hunter is indeed a "big thing.".... From present indications, the Fair Play, located near Saa Andreas, will prove very rich at so very distant day. The company have an arastra at work crushing rock which yields twelve dollars to the hundred pounds, or \$240 per ton.

The workmen in the quartz claim of Wm. Irvine, at El Dorado, says the *Register* of the 28th, struck some very rich rock during the past week. They have drilled some forty feet north on the lead, and from two blasts, it is believed that the rock taken out will yield three thousand dollars.

The *Chronicle* says of the West Point mines: Barnes & Karstner cleaned up \$4,500, the result of sixty-five tons of rock taken from their lowest tunnel, 150 feet below the surface. After working the lead some seventy feet deep, the value of the ore decreased from \$100 to fourteen dollars per ton, but still paying the owners a handsome profit.... Carlton & Co. have a vein six inches wide, prospecting \$200 per ton.... Gouldson & Co. have struck a vein described as "bully".... Wilson & Matthews are profitably working a vein from two to four inches in width; the rock will pay \$130 per ton. Fields & Co. are still sinking; the vein is fifteen inches wide at the depth of fifty feet, and will probably yield \$70 per ton. * * * In view of the natural facilities assisting the miner, the high quality of ore extracted, and the enormous net yield of mining operations, the quartz mines in the vicinity of West Point are probably second to none on this coast."

Humboldt County—

Mattolie correspondence of the *Times*, dated August 20th, says: The Davis well has attained a depth of 1,180 feet; the Jeffrey well 840—indications in both unchanged, except, perhaps, a little more gas than usual. The Ponner Farm is progressing finely. Every one agrees that prospects here are very flattering. Some of the stock in the Yosemite has changed hands, and the company are going to resume work immediately.... The Union Mattolie Oil company has levied an assessment of fifteen dollars per share on all the shares of stock assessable as well as unassessable of the company.

Kern County—

The *Havilah Courier* of the 25th has the following items: The Soyola mill will soon be

at work upon the ore from the Delphi.... We are continually hearing of the discovery of new leads in the various mining districts of the county. The latest discoveries have been made in the new Washington District, on Kern River, and they are represented as being very rich. Claims are doubly valuable on this river, because of the great water-power it affords. Probably the facilities for water-power mills are better on Kern river than any place in the State.

Same paper of September 1st, says:—Mr. Joseph Roberts of Long Tom District, superintendent of the Long Tom Mine and Mill, gives very flattering accounts of that section of our county.... Some fine specimens of rock from the Delphi mine, taken at the depth of one hundred feet, were left with us and prospecting well. Some ore from the Washington lode, in the Rio Bravo district, discovered by John Poe, also showed a fine prospect.... The Cape Horn has been opened to the depth of forty-two feet, and shows a lode of three feet in thickness. It bids fair to prove the best mine of the "Bigler Purchase." The French Friend shows a ledge of two feet at the depth of forty.... The new mill of the Rand company is completed, and is at work crushing the ore from the Relief and Fame lodes. The former has a ledge of four feet at the depth of two hundred feet.... The Jupiter company are energetically at work upon their mine. Their No. 2 is seventy-five feet in depth, and the vein from two to six feet in width. The tunnel is in two hundred and twenty feet. Twenty feet more will strike the ledge at the depth of one hundred and fifty feet.... The Venus is in sixty feet, with a three-foot vein. Rock yielded \$38 per ton.... The Delphi lode has been sunk upon to the depth of three hundred feet. Vein averages over four feet. This will, we predict, prove a valuable mine. It has just been opened. A large quantity of rock has been worked, all of which paid well. This and the Countess of Tyroae are owned by McKeadney, Treadwell and others.... The Bamboo and Boomerang lodes, owned by James Eldridge, are promising. The latter is three feet thick. Several crushings from it gave a result of \$25 to \$30 per ton.

A letter to the *Tulare Times* of September 1st, says:—The Long Tom company have a tea-stamp mill, about one-fourth of a mile from the mine, and crushing from fifteen to eighteen tons per day. The ledge is one of the largest and finest I have ever seen, and from what the Superintendent tells me, and from the "prospects" I have made from it, pays better than any in Southern California. The main shaft is now down 165 feet on the ledge. They are driving their work, sinking, drifting and stoping night and day. Last week the sale of a one-half interest in the Isabella, Mary Wallace mine was made to a San Francisco capitalist. This ledge is about one mile north of the Long Tom, and is very rich. A sale of half of the Robert E. Johnson mine was made last week. This claim is but a few rods south of the Long Tom, has paid from \$25 to \$90 per ton, and has been worked about five months. The Mary McDonald mine, about one-fourth of a mile south of the Long Tom, has been worked successfully and profitably for the past fifteen months.

Klamath County—

The Humboldt *Times* of August 25th, says: The Red Cap Copper Mining Company have just received another installment of ore from their claim in Klamath county, in quantity about two and a half tons. The quality of this ore is still very superior. There is but little doubt now that they have a claim of great value. One thing is certain, the ore they are taking from it is of surpassing richness.

Mariposa County—

William T. Bourne, who was sent on from New York by the company now running the Fremont estate, reports August 3d on his return, after having spent two and a half months on the estate, that he finds it an extremely valuable property, and that the company would be warranted in making an immediate appropriation for its further development. He names each of the mines in turn, and states that every one of these can be made to pay at once, with but a small outlay. He says there are 150 stamps in good working order, capable of crushing 250 tons per day. He alludes to a new process introduced at the Benton mills during his visit, by which it is claimed that a yield of \$28 per ton was obtained from rock which as previously worked, would not pay expenses, and recommends its introduction at the other mills on the estate. He states that from recent experiments upon the large piles of tailings at the different mills, it is evident that the owners of the property have in sight at least one million of dollars, which can be realized at a cost of less than one-half that amount.

Nevada County—

From the *Gazette* we clip the following items: Captain Fleming, who some time since resumed work on his ledge, has struck through into the works of the Italian Com-

pany. We were shown, yesterday, a specimen of very rich sulphuret ore from Fleming's tunnel.... We understand that a rich strike was made recently in the incline of the Union ledge. The rock taken out the past two or three days shows much free gold, and will pay largely.... The name of the Star Spangled Banner Mine has been changed to "Banner.".... The shaft in the Fox Copper mine is down 45 feet. Ore averaging thirty per cent. has been struck.... We saw yesterday (Sept. 1st) some extraordinary rich specimens of gold bearing quartz. They came from a ledge belonging to Lethe & Cressy, near Wood's ravine. Some fifteen or twenty pounds of the rock, brought in from the ledge yesterday, we should think would pay five or six dollars a pound, and we are informed that a large tub full of the same kind had been taken from the mine.... Arrangements have been made for erecting hoisting works on the Mattingly ledge.... The certificate of incorporation of Ancient River Channel Blue Gravel Mining Company has been filed in the Clerk's office at San Francisco. The claim of this company is situated on the Chalk Bluff ridge, commencing at the upper end of the claim of the Chalk Bluff Company, and extending up the ridge ten miles. The locators, D. O. McCarthy, and others, will commence operations at Bear Valley, and sink for the bottom of the ancient channel.

The Grass Valley *Union* of August 30th, says: The Washington ledge on the Ben Franklin Hill, is looking better than ever. An interest of one hundred feet was sold during the present week for \$1,500 cash, and the trade is here regarded as an excellent one for the purchaser.

The same has a series of articles entitled "Our Title-Regulators." The series extends through former issues, and handles roughly those who make it their business to throw doubt upon titles, and to trump up bogus or bring forward obsolete claims to mining ground. The editor says: "Go in whatever direction you may from Grass Valley—for our town is a center-set jewel in quartz and gold—discover a ledge, commence working on it, and if it shows the least indication of being rich, you either at once have a lawsuit to fight, or you are cajoled or frightened into giving up your location." A paid witness makes oath to the twenty days' work yearly required by law, and you are either ousted or black-mailed. "These unprincipled adventurers have done much toward retarding the prosperity of our mines. We have it on good authority, that a gentleman representing one of the heaviest moneyed firms in the East, who has twice visited Grass Valley with the intention of investing in our quartz mines, left the town in disgust, because in almost every case he had the assurance of some 'knowing ones' that he was about to purchase for himself an extensive lawsuit or series of lawsuits."

The *National* has these items: The ledge was struck this morning in the northern extension of the Ophir mine on Ophir Hill.... The old shaft, in the Ophir, which is now nearly six hundred feet deep, is yielding some beautiful rock, most every piece containing more or less gold visible to the eye. The new shaft is now some three hundred and twenty-five feet deep and is producing some very pretty rock.... At Osborne Hill, Woodworth & Co. are now down on their ledge about three hundred and forty feet. In the incline rock is now being taken out ore which yields about \$15 to the ton.

The *Transcript* learns that an exceedingly rich ledge was struck near Allison's Ranch on Saturday, August 18th. The vein is six inches wide, and is nearly one-third gold. It is called the Red White and Blue.

EXCELSIOR.—The *Gazette* says: A number of Meadow Lakers have been sojourning in Nevada for the past few days, and bring, on the whole, favorable reports of the mining prospects of the township. The transient population, and those who went there to speculate and buy and sell stocks, have mostly left, while the mine owners in general, having given up the idea of making sudden fortunes, have gone to work systematically to develop and prove the value of their claims.

The following items are from the *Sun* of Aug. 30th: The Excelsior mill starts up on next Monday. The machinery is being rapidly put in readiness.... Bullion, to the amount of \$1,716.37, from the Western Company, Pennsylvania ledge, near Carlisle, was received here for shipment yesterday.... The Moscow Company, Moscow ledge, in the immediate vicinity of the Pacific, are sinking a shaft. They have gone down only about six feet, but have made arrangements to descend forty feet lower. The mine prospects well.... The Pacific Company, Pacific ledge, have a working shaft down forty feet. The company is raising a drift along the ledge from the bottom of the shaft, in a southeasterly direction, and are taking out an abundance of rich ore.... The Galena Company are making a cut across their ledge.

Placer County—

The *Stars and Stripes* of Sept. 5th has these items: The Norfolk company, whose

claim is located near Ophir, are hard at work, and taking out some very fine rock. Walters has taken out of his claim in the same vicinity about a hundred tons of splendid rock, and frequently picks up fine specimens rich with free gold.... Twenty-five tons of rock—selected as the poorest taken from the ledge—from the Civil Rights claim, have just been crushed at Wely's steam mill, below Ophir, and the yield is some four or five ounces of free gold, and about 600 pounds of sulphurets, valued at from \$500 to \$600.... The Wells' lead at Bald Hill is an extension of the famous "Green Emigrant," and, in the language of one of the fortunate locators, is "the biggest thing in the county," according to present appearances. The company sunk a shaft on the ledge to the depth of eighteen feet, following the casing down beside the ledge, and on Monday put in a blast to the depth of fifteen inches, which displaced a large quantity of rich rock, but did not go through the ledge.

Plumas County—

The *National* of Sept. 1st says: We learn that Mr. H. C. Bidwell, who has been sinking a shaft upon the Union ledge, in Indian Valley, has struck the ledge, and discovered an excellent prospect.

Letter to same from North Fork, dated August 27th, has these items: Osborn & Brewer's claim is paying wages.... Hall, Brown & Co. are not down yet, but will strike bed rock this week.... Richards, Self & Co. have struck bed rock and obtained good prospects.... Morris & Clarke have the best claim on the river, if not in the county. Their claim is paying one ounce per day to the hand.... The French company have been taking out large pay—as much as \$3,000 per week—but it weakened on them a little last week. The Jaw Bone company have taken out some good pay, obtaining as high as five dollars to the ton.... Lynn, Cook & Co. are on bed rock making wages.... Levett & Davis struck big pay, running out \$4 in one afternoon.... Benham, Wagner & Co. are taking out good pay in the old Vansickle claim.... Thompson, Reed & Co. are still piling in the Osborn ravine, and expect to make a big clean-up in a short time.... At Twelve-Mile Bar, York, Messner & Co. have in 400 feet of flume. They have just got their claim dry, and expect to do well.... On Ding Bar, Kiser & Co. are still piling.... On the Torey Hill, Hallstead & Davis have stripped two or three acres of bed rock, but have not cleaned up yet.... Rich Gulch has dried up for the season.

The correspondent of the *Appeal*, under date of August 23d, from Nelsona Point, says: Richard & White are not down yet. They have three large pumps running, which does not keep the water out. Shubert & Co., in Nelson Creek, are washing tailings and all, from top to bottom. I hear that it pays well. Some of the Celestials have worked out their first claims, and now have other wing-dams in. Bonner & Hardy's hydraulic claim, at Clip Flat, has proved a fizzle.

San Bernardino County—

We clip the following from the *Los Angeles News* of August 21st: Our townsman, Mr. P. Beaudry, one of our largest and most enterprising merchants, has brought from the Rochester mine, situated in the Slate Range district, gold bullion weighing twenty-three pounds, of a value of \$4,410, the product of 120 tons of quartz, showing an average of \$35 per ton.

The mine is located in the most western portion of San Bernardino county, Slate Range district, about one hundred and fifty miles from Los Angeles. This mine has been in product for nearly four years, and above 5,500 tons has been reduced on an average of \$16 per ton, but through the many improvements, incident expenses for roads and running tunnels, the owners became embarrassed, and this mine, with the Albany, Cattaragus, Knickerbocker and Philadelphia, known as the Rochester Consolidated Gold and Silver Mining Company, with all its appurtenances, thirteen stamp steam mill, etc., were sold by the Sheriff on the 10th of February last, to Mr. P. Beaudry, who took possession and was appointed receiver by the Court, until the expiration of its redemption which was until the 10th of August.

Shasta County—

The *Courier* of Sept. 1st, gives these items: Mr. L. A. Kelly has just completed a 4 stamp mill on one of the Jollie ledges, at Muletown, and will commence crushing rock immediately.... The assay from the two tons of Mammoth rock, spoken of last week, showed a result of \$202.... The Potosi is doing better than its most sanguine stockholders anticipated. After crushing thirty-five tons of rock, the superintendent partially cleaned up, with a result of \$1,987.18.... Among the many mining enterprises inaugurated of late in Shasta county, one of the most notable is the Horse Shoe Bend, on the Sacramento river, about thirty miles above here. At this place the river makes a bend of about three miles in the shape of a horse shoe. At the "heel" is a mountain 500 feet through. A company was organized last year for the purpose of tunneling through

this mountain. On Friday of last week, the head him was knocked out, and the waters of the Sacramento rushed, boiling, through the tunnel, leaving the old river bed with scarcely a sluice head remaining in it. By the success of this enterprise a strip of mining ground three miles in length, and from twenty-five to one hundred feet in width, is laid bare.

Sierra County—

The *Messenger* of 1st inst. has the following: Work on the Oro is progressing rapidly and satisfactorily. . . . The Good Hope company are still taking out rock for crushing at the Gold Bluff mill.

Tulare County—

The *Visalia Delta* of August 29th says: We hinted two weeks since at probable discoveries in quartz. We referred to discoveries of gold—amazingly rich—recently made on the tributaries of the Kawiah, of which more anon. Just at present we announce that parties have discovered in the immediate neighborhood of the new trail to Kearsarge an enormous ledge of the richest copper ever discovered in the State. The ledge stands up 800 feet high and more than twenty feet in thickness upon the face of an abrupt cliff, which is bisected from top to bottom with this immense metallic vein.

Tuolumne County—

The *Columbia Citizen* has the following: The Fair Play Quartz company, at San Andreas, are crushing rock with an anstrax which yields \$540 to the ton. . . . Correspondent of same says: The reports that reach here from the Mount Vernon mine, at Sugar Pine, are creating much talk. People don't seem to understand how a mine only just open can pay such large dividends. They don't understand that, had it not been for the fortunate circumstance of there being an unemployed mill close at hand, which enables the owners of the Mount Vernon to work their rock as fast as they take it out, without waiting to put up a mill of their own, this mine would, in all probability, have suffered the same fate as the Stewart and many other rich claims.

Yuba County—

The *Appell* of Sept. 4th, gives these items: We understand that the Pennsylvania mill cleaned up a good sized "brick" on Sunday, the amount being quite satisfactory to the owners. The rock crushed in the month of August averaged \$33 in the ton. The company has been for months drawing rock and water from a depth of 450 feet, and running an 8-stamp mill with a 15 horse power engine. Crushing under such disadvantages has been slow—seven or eight tons of rock a day. The new mill, with sixteen stamps, is expected to be in running order by the first of November, when forty tons per day will be crushed. . . . The Jefferson has stopped for twenty days to put in new machinery, which is on the ground. They cleaned up on Sunday \$12,000.

NEVADA.

Washoe—

The Gold Hill *News* of Sept. 1st, says: The shipment of bullion from Gold Hill, by Wells, Fargo & Co.'s express, during the month of August, amounts to 352 bars and 18 sacks, valued at \$692,134.28. To this should be added \$80,000 worth of bullion sent to Virginia assayers by the Yellow Jacket company, and shipped from the express office in that city. This aggregate \$772,134.28 as the August yield of Gold Hill mines, so far as assays indicate. This is the largest monthly shipment ever made; but it is confidently expected it will be the smallest of the last five months of 1886. The yearly average it ciphers exceeds nine millions of dollars. Is it necessary to call attention, in so many words, to the fact that the Gold Hill mines are giving out?

Reese River—

The *Reveille* has these items: The Metacom mill is progressing finely; the stone walls of the different compartments are nearly finished; the engine is set upon its bed of deep and solid masonry; and the brick for the reverberatory furnaces are being hauled to the ground. The mill will be a complete, well-arranged structure, and will be put in motion about the first of November, with a battery of ten stamps, six Freiberg barrels, and four furnaces. By that time there will be ready for reduction about 1,000 tons of ore worth \$125 per ton. . . . The incline on the Old Colony has reached the depth of nearly 300 feet. . . . A bar of 772 ozs. 990 fine, was the product of ore from the Providential mine. . . . We learned to day the result of the reduction of six and a half tons of ore from the Canada ledge, situated in Summit Canon, Twin River district. The ore was worked at the Keystone mill, and yielded a bar of bullion of the stamped value of \$897.58. . . . During last week, 4,500 pounds of ore, obtained in equal parts from Buell's locations on the High Bridge and El Dorado ledges, in the Philadelphia district, were taken to the Keystone mill for reduction. The yield was a bar of \$673—about \$300 per ton.

On the 13th of August, Messrs. Leach, Noon and Sides, of Austin, discovered a lode of extraordinary richness on Rattlesnake Canon, in Hot Creek district. It was named the Key-

stone. The ledge at the point of discovery shows a width of three feet, and is a mass of ore of the richest character, consisting of horn silver, metallic silver and stromeyerite, and is the most formidable rival to the famous Old Dominion ledge that has yet been found in the district.

A party of prospectors located several claims in the region southwest from Hot Creek district a short time since. The Orient, five feet in width, the Fairview, ten or twelve feet, and the Atlantic forty feet in width, were next discovered. Then the Crescent, fifty feet wide. Of the two latter, the "Notes of a Prospector" say: "These two lodes probably show more horn silver than any veins yet discovered. An assay of the Atlantic gave \$1,658 per ton. A new mining district was formed and called the Reville district, in honor of the journal which has done so much to make Central Nevada famous."

We quote a few lines from the editorial of same: "Nowhere in the world are such opportunities offered, as are now offered in central, southern and southwestern Nevada. Ledges of great size and in unlimited numbers, producing ore of a richer character than ever before recorded in the history of mining, exist on all sides, and invite capital with brighter promises and more certain assurance than it was ever before invited to any enterprise."

Correspondence of the *Bulletin*, says of the "Old Dominion" four miles south of Hot Creek. The ledge has fifteen feet of pay ore, assaying from \$200 to \$14,000 per ton. The owners have refused \$50,000 for the 1,400 feet in the claim.

Esmeralda—

The *Union* of Sept. 1st gives the following items: The Janata is now being opened in good shape and the mill refitted. . . . The Fal Kirkton now promises well. . . . Messrs. Brown & Pope have made a sale this week of their mine situated on Silver Hill, and known as the Olive Branch lode, to Messrs. Winters and O'Neal, for the sum of \$3,000 cash in hand. . . . Samuel B. Martin has a 40-stamp mill en route for the Silver Peak district.

Humboldt—

The *Register* of August 25th has these items: At Star City W. D. Robertson is vigorously prosecuting work in the Yankee—running night and day. Tunnel in 450 feet. . . . The American Basin company continues its work with unusual energy. Tunnel in 750 feet. All signs indicate that the ledge is near at hand. . . . In the Andy Johnson, located in Table Mountain, thirty miles south of Unionville, work has been rapidly progressing for the last six weeks. A tunnel run in on the vein a distance of fifty feet, exhibits a well defined gold-bearing lode of an average width of six inches, which pays handsomely throughout the entire vein, even with the slow process of an anstrax. Fifty feet in a very rich pocket has been struck, at which point a shaft is now being sunk following the vein. Judging from the general yield of the ore taken out of the tunnel, it is believed the ore from this pocket will pay seven hundred dollars per ton. Several tons of this character of ore are now on the dump.

Pahranaagat—

A letter to the Salt Lake *Vedette* says: The Illinois ledge is well defined, and crops out twenty feet above the surface on the top of the mountain. It can be traced through the range, and is from ten to thirty feet wide. The crop pings show rich in chloride of silver. There is a sufficient amount of pay rock in sight to run a mill for years. At Logan, three miles south of Silver Canon, Dr. Congar has erected a roasting furnace and a blast furnace. Capt. Dahlgren has also built a blast furnace. * * * My opinion is that this mining district is the richest I have ever seen—at least on top." It is 140 miles from Calville, 230 from Austin and 400 from Salt Lake City.

ARIZONA.

We clip the following from the *Gazette* of August 16th: The copper mines at Williams' Fork are turning out very rich ore. Much of this has been shipped to San Francisco. Smelting works have been recently erected, and are a success. Ore that will not bear the expense of transportation will be made into ingots on the ground. It is said that it will pay to ship coal from San Francisco for that purpose. The Planet company have already shipped several hundred tons of rich ore, and have some two hundred tons ready for shipment, taking out about sixteen tons of ore per week, which averages from twenty to seventy five per cent. . . . At the Challenge they are working twenty men, and take out ore, rich in gold and copper. . . . Martin & Co. are working Mineral Hill and other mines. They are putting up an engine and two smelting furnaces. They take out some eight tons per day, assaying from twenty to sixty per cent. . . . The Great Central company are working their Eliza mine, and have a fine prospect. A smelting furnace has lately been put in operation. About three hundred tons of smelting ore have been taken out, about half of which will, it is said, yield

sixty per cent., the rest from fifteen to twenty. Considerable ore containing blue silicate of copper, hitherto disregarded, is now found to give forty per cent. . . . Parties from New York are at work on the Carbonate. . . . In the Harcuvar district, about forty miles from the Colorado, rich copper ores are found. All work is suspended for the present, but operations will be commenced extensively in the fall. The ore is of very fine quality, quite easy to smelt. It assays from twenty to forty per cent. There is plenty of wood and water on the ground, and smelting furnaces are to be erected. . . . On the Cunningham lode a shaft has been sunk some one hundred and twelve feet, and it is rich in copper all the way down. About two hundred tons of copper have been taken out. Several other shafts have been sunk from twenty to thirty feet.

Twelve miles nearer the river are situated other promising lodes. At the Comet, about twenty tons of good ore, paying forty per cent. have been taken out.

IDAHO.

A correspondent of the Nevada *Gazette* says of the Poorman mine: A shaft has been sunk to the depth of 160 feet, where the vein is two and a half feet in width. In the center of the ledge is a vein of some twelve or fifteen inches, so rich in silver that the company are having it for shipment to Swansea, Wales, where it can be properly worked. They have out about nine tons of this ore, which is estimated to be worth \$10,000 a ton.

The Idaho *Statesman* reports the finding of a gold nugget in Alturas county, worth two hundred and thirty dollars. It is said to be the largest nugget ever found in Idaho, and was taken from a claim in Quartz gulch, between the celebrated Atlanta and Leonora ledges. Several smaller nuggets were found in the same claim.

The *World* of August 18th, says: The ledges at Banner (formerly called Silver Hill) in this county, are prospecting even better than was anticipated by the locators. On the Black Warrior a shaft has been sunk which is developing rock of the most extraordinary wealth. The Victoria and the Pacific are also highly spoken of.

COLORADO.

The Denver *News* of August 22d, has the following: The Colorado and St. Louis Silver Mining Company, organized under the laws of Illinois, with powers to operate in Colorado territory, owns 18,000 feet of choice silver property in the Snake River mining district. The capital stock of the company is half a million dollars divided into ten thousand shares of fifty dollars each. The company will immediately proceed to the erection of the necessary works for the reduction of their ores.

The Snake river silver mining region is undoubtedly among the richest ever discovered in the world. The average of the assays from there show a richness of the ores more than that of any other mines yet known.

MONTANA.

The Helena *Radiator* of August 4th says: A great deal of faith is left in the Dry Gulch by many parties, and a number of claims have recently changed hands at advanced rates. As soon as an abundant supply of water can be procured, we are confident that a large proportion of the claims in that gulch will pay fair dividends. With the present very limited supply several claims are yielding a good profit above expenses. . . . A safe with seven hundred pounds of clean gold, left Helena for New York, via Fort Benton and the Missouri river, a short time since. It was taken from one claim in a few weeks' work, besides enough to pay all the expenses.

Indian Creek correspondent of same, writing from Pahranaagat, July 29th, says: There are two companies now engaged in running drain ditches—one will be completed in seven or eight days, the other in about three weeks. Besides the creek mining there will be a considerable amount of labor done on quartz. There are several good lodes discovered now in this vicinity, namely, the Lincoln, Constellation, White Chief, Golden Crown, and Prairie State. On the two latter the proprietors are now engaged in getting out quartz; the Golden Crown is down thirty feet, and the Prairie State twenty three feet.

A letter from New York city (M. T.), to same, says: The placer diggings in this vicinity are being worked to a considerable extent, and found to pay exceedingly well. Mr. Woodson, the other day, took out of his discovery claim, in Cave gulch, nuggets weighing \$250 to the pan. * * Among the quartz leads, the Star of the West, owned by Wessel & Wilkes, is fully developed, and has a shaft sunk to a depth of fifty-five feet. The Bigler, Alta, Home Ticket, Little Giant, Silver Chord, Montana Chief, and Excelsior No. 2, are more or less developed. The rock is crushed or ground in anstrax. * * Wessel & Wilkes are erecting a splendid quartz mill on a small scale, running six stamps and driven by water-power, with an overshot driving wheel of eleven feet in the clear. . . . The mill of Ramley & Watson, I am

informed, they intend running in ten or fifteen days. . . . The Gaston & Simpson company are building a 30-stamp mill. The buildings cover an area of 300 by 400 feet. The engine and machinery are all on the premises, excepting the boiler. The stamps are each 650 pounds in weight, and the engine of 45 horse power. The company expect to have their mill completed on the first of September next. . . . Farrow Bros' anstrax cleaned up, after a run of seven and a half days, from 3½ tons of top rock, from the Bigler lode, the sum of \$350, being an average of \$100 per ton.

[The above, from Montana, was put in type for last week's issue, but was unavoidably crowded out for want of space.]

UTAH.

The *Vedette* of August 30th has the following items: We learn that there is considerable excitement about mines in the vicinity of Minersville, which is about half way between this city and the Pahranaagat mines. A Mexican has turned up who says he with others discovered and worked eight silver ledges in that vicinity fifteen years ago, but was driven off by Indians. A large number of prospectors have been out, and they report the discovery of some rich ledges. . . . Some excitement exist in regard to the City Creek mines. No one has reached the bed-rock yet, but on the surface and six feet down the rock pays from three to ten cents per pan, and they will have to dig down fifteen or twenty feet before striking the bed-rock. These mines are fourteen miles from Salt Lake City. . . . Yesterday we received a call from Dr. Davidis, who is engaged in constructing furnaces at the Cottonwood mines, about forty miles from this city. He informs us that he has a furnace that will consume about three tons of ore per day, nearly completed, and by next week he will turn out the first silver brick ever produced in Utah.

BRITISH COLUMBIA.

The *Colonist* has these items: From a merchant who left McElloch creek on the 13th instant, we have most exciting Big Bend news. Rich discoveries of gold bearing quartz have been made in the mountains adjoining McElloch creek, by Charles Smith, of Victoria, who is on his way down with specimens. The gold is plainly visible. . . . A vein of rotten quartz has been struck by Mr. Hicks, of New Westminster, in the same range of mountains. The gold is easily separated from the quartz by pounding. The whole country is excited over these important strikes, and a large number of miners are out prospecting. . . . The Discovery company, on McElloch creek, have tunneled into the hill and got a prospect of \$23 to the pan, coarse gold; \$280 in nuggets, the smallest weighing \$250, have been picked from the bed-rock in the same claim. The tunnel is in 130 feet. . . . The news is good from French creek. Back of the Shrop. Bailey claim, a company working in the bench got a prospect of \$19 from a few pans of dirt, in coarse gold. The whole bank has since been staked off by miners. . . . From Kootenay it is reported that Mr. Stronach, of Victoria, has realized a large fortune from mining in the hill. . . . We were shown lately a sample (2½ ozs.) of gold from the new diggings on the Lillooet river, twenty-four miles out of Douglas. The gold was sent down by Mr. J. Franklin, and is fine flour gold, very similar in appearance to that taken from the bar diggings on the Lower Fraser. . . . Mr. J. E. Edwards, just from Cariboo, exhibits a bar of gold weighing \$119.17—the product of three hours' ground sluicing, which he washed on a new creek, a tributary of the South Fork of Quenelle. The creek he called Cedar creek. He has also discovered another rich creek in the same locality. Several hundred men have started for the new diggings. Cedar creek is larger than Williams' creek. The Saskatchewan gold mines are attracting much attention.

HURRYING UP THE IRON HORSE.—Work upon the California end of the Pacific Railroad is now being pushed ahead, both day and night. It is found that the night shifts accomplish more, and with far less discomfort, than the day shifts. This is Californian, all over. Will not our Eastern friends make a note of it? Why not adopt the plan generally in such work. The sooner such an enterprise is finished, after any considerable investment has been made, the sooner will the capitalist get his money back. Night shifts on railroad work is an eminently practical idea.

TUNNELING THE MISSISSIPPI.—So many objections have been urged against bridging the Mississippi at St. Louis, that the railroad companies have determined to tunnel the "Father of Waters" at that point. The cost is estimated at \$3,000,000, and the time for executing the work three years. The tunnel will be a little less than a mile in length.

Mining and Scientific Press.

W. B. EWER, SENIOR EDITOR.

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. Thomas Starr is Agent for the MINING AND SCIENTIFIC PRESS in Nevada, and will canvass the principal cities, towns and districts of that State. August 23, 1866.

Mr. O. P. Truesdell will act as our Corresponding Agent and Solicitor, in the interior of this State, from this date. August 23, 1866.

Mr. E. F. Dewey is duly authorized to receive subscriptions and advertising, and transact business for this office. August 18, 1866.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. San Francisco, Jan 11th, 1866.

Mr. J. N. Hudson, is authorized to solicit subscriptions, advertising, etc., for the MINING AND SCIENTIFIC PRESS, in San Francisco, and to receipt for the same.

San Francisco:

Saturday Morning, Sept. 8, 1866.

IN MEMORIAM.—The flags of the several foundries and machine shops in this city, were flying at half-mast on Thursday last, in token of respect to our late fellow-citizen, Samuel Aitken, Vice President of the Vulcan Iron Works Company, who died during the previous night. The deceased, who was a native of Scotland, was one of the founders, and ever a most active member of the St. Andrew Scotch Benevolent Society of this city, a thorough mechanic, a highly valued citizen, and one held in especial esteem by his fellow craftsmen, and all who knew him. He died of consumption, at the early age of 43 years. His funeral took place yesterday, under the auspices of the Masonic fraternity. The Vulcan Iron Works Association, within less than two years, have been called upon to part with two of their most efficient members and leading officers—Paul Torquet, their former President, and now their second officer, Samuel Aitken.

NEW METHOD OF RAISING SUNKEN VESSELS. Mr. J. Begg, of Victoria, V. I., has made an important discovery which he claims to greatly cheapen and expedite the process of raising submarine bodies. He is now on a visit to this city negotiating for capital to assist him in proving to the public the immense value which is accredited to his invention by civil engineers and others who have examined his plans. He is confident of being able to raise ships of any size from a depth of one hundred fathoms. The cost of the apparatus required is comparatively small, and when once constructed, the inventor estimates that any ordinary ship can be raised from fifty to one hundred fathoms at an expense not exceeding \$1,000. Mr. Begg proposes to apply his invention first to the raising of the steamship *Labouche*, provided suitable inducements are offered. It is his intention to immediately apply for patents for the United States, England and France. He can be consulted at the Tremont House, in this city. We expect in a short time to give a descriptive illustration of this invention.

TO CORRESPONDENTS.—We have received communications from two different parties who have had considerable experience in the use of syphons, which we shall publish next week. A communication from "Sulphuret," is also received. The information he furnishes will be read with interest. A communication from Excelsior District is also on file for publication.

SHIP CHANDLERY.—Charles Witte, corner of Shasta and Michigan streets, Potrero Nuevo, has opened a ship chandlery. He furnishes all kinds of ship materials at same prices as are charged on this side of the Long Bridge.

A PROFITABLE WORK.—Horace Greeley is said to have already cleared \$110,000 from the first volume of his "History of the Rebellion."

NEW SOURCE OF WEALTH.

A very singular mineral deposit was discovered, some two years since, about four miles north of the town of Lincoln, in Placer county, which was first located for copper—some very rich carbonates and oxides, with occasionally native copper, being taken out. Subsequently, however, it was found to contain such a large proportion of gold that a stamp-mill was put up with the view of working it as a gold mine. The following paper, descriptive of this interesting locality, was recently read by Prof. Blake before the California Academy of Natural Sciences, under the head of

A QUARRY OF GOLD-BEARING ROCK.

The Baker or Whisky Hill mine of Placer county, a few miles from Lincoln, presents the novelty of profitable gold mining from a quarry in the slates, without any well defined quartz vein. A hill with a rounded outline is covered with rough outcrops of rusty slate over a breadth of 200 feet or more. A quarry at one end exposes the slate with a great variety of colors, from white to brown, red or black, the whole of it being soft and ochraceous, and in places stained green and blue, with carbonate of copper. These variegated slates are like those commonly known among California copper prospectors as "calico rock," and the ground was first located and prospected for copper.

It is evident that the formation consists of beds of iron pyrites (mudic), with a small but variable portion of copper pyrites, and that the rusty upper portions are due to the gradual decomposition of the sulphurets above the permanent water-line, or where the atmosphere has had access. Below the water-line we may not expect to find the rusty ochrey slate. This is shown also at a shaft which has reached the water. Blocks of mudic taken out of that shaft are interstratified with talcose slate. At one point in the bottom of the quarry a layer of green and blue carbonate of copper is found, and this is evidently the result of a gradual concentration of the copper from the decomposed ground above. The soft slate as quarried is trammed to a 5 stamp mill, with very coarse grates, and nearly forty tons are run through it daily. The pay is said to vary from two to twenty dollars, but the average is reported to be from five to six per ton.

It will be recollected that this result is obtained from a battery with open grates, instead of the usual quartz screens. It is but fair to estimate from the above, that with proper appliances, the average yield will be increased to \$10 per ton with improved machinery.

One-half of this property has recently been sold by Messrs. Treadwell, Harpending & Co., to Messrs. A. C. Peachy, M. Attwood, O. Hoffman, George D. Roberts and others. The price paid was \$175,000. This company is substantially the same as that which recently purchased the North Star and several other valuable mines in Grass Valley. This new company will soon erect a 40-stamp mill, in addition to their present machinery, with which they will be able to work at a profit the products of this mine, which do not pay over one dollar per ton. This will be crushing cheaper rock, and more of it, in proportion to the weight of machinery employed, and at equally as good profit, as are reported for the results of the celebrated Black Hill mine in Australia.

A similar deposit to the above is said to be found at Sanders' ranch, three miles north of Virginia, also in Placer county, and we learn from the *Placer Herald* that the agent of a New York company has recently purchased this mine, and has now on the premises and nearly erected the machinery for a 10-stamp mill, which will be in running order during the present month.

There is little doubt but that similar deposits will yet be found in numerous other localities along the foot-hills, throughout the entire length of the State. It is, doubtless, similar to that which occurs, but in less quantity, in the neighborhood of Telegraph City, Calaveras county. There is much reason for presuming that when a considerable depth is reached, these mines will yield copper instead of gold. At all events, the proprietors will soon pass through the decomposed portion of the vein, and have sulphurets and hard rock to deal with; but whether auriferous or cupriferous, they will doubtless, still continue to be profitably worked. It would be well for prospectors in the foot-hills to familiarize themselves with this peculiar class of mineral deposits.

SPECIAL COMMISSIONER FOR MINING STATISTICS.

Our readers will be pleased to learn that J. Ross Browne, Esq., who has recently been appointed by Secretary McCulloch a Commissioner to collect mining statistics on the Pacific Coast, has arrived, and is making preparations to enter actively upon the duties of his commission. By permission, we are allowed to publish the Letter of Instructions, furnished him by the Secretary of the Treasury, on his leaving the East for the field of his labors on this coast. The instructions, it will be observed, are very comprehensive, and call for a vast amount of labor—totally disproportionate to the amount of money appropriated therefor. The work which is to be undertaken is identified with the best interests of the miners, who should, one and all, interest themselves actively in aiding in the collection of the information called for, and which is to be essential to securing a proper understanding at the East with regard to the condition and wants of the mining public on this coast. The indefatigable energy of Mr. Browne as a traveler, his habits of close observation, taken in connection with his extensive acquaintance with the mines, will enable him to collect and lay before Congress and the country, at an early day, a vast amount of useful and practical information, such as will doubtless induce Congress to be more liberal in future in its appropriations for this purpose.

The country is also largely indebted to Secretary McCulloch, for the interest he has taken in securing this action in behalf of the great mining interest of the Pacific Coast. We shall, next week, give some information as to what has been done by other Governments, in the way of collecting mining statistics and the benefits which have resulted therefrom. We shall also soon be able to communicate more fully the plans which the Commissioner will adopt for collecting his information. In the meantime we would call the special attention of our readers to the general plan of the Commission, as set forth in the Letter of Instructions from Secretary McCulloch:

TREASURY DEPARTMENT, }
August 2d, 1866.

J. ROSS BROWNE, Washington, D. C.

SIR:—In entering upon your duties as Special Commissioner to collect mining statistics in the States and Territories west of the Rocky Mountains, it is important that you should clearly understand the objects designed to be accomplished by this Department and by Congress.

The absence of reliable statistics in any department of the Government on the subject of mines and mining in our new mineral regions, and the inconveniences resulting from it, induced Congress, at its last session, to appropriate the sum of ten thousand dollars for the collection of information of all kinds, tending to show the extent and character of our mineral resources in the Far West.

The special points of inquiry to which your attention will necessarily be directed are so varied, and embrace so large a scope of country, that it will scarcely be practicable for you to report upon them in full by the next session of Congress.

I entertain the hope, however, that you will be enabled by that time to collect sufficient data to furnish in the form of a preliminary report, the basis of a plan of operations by which we can in future procure information of a more detailed and comprehensive character.

The success of your visit to the mineral regions, in carrying out the objects contemplated, must depend in a great measure upon the judicious exercise of your own judgment, and upon your long practical acquaintance with the country, your thorough experience of mining operations, and your knowledge of the best and most economical means of procuring reliable information.

The Department will not, therefore, undertake to give you detailed instructions upon every point that may arise in the course of your investigations. It desires to impress upon you in general terms a few important considerations for your guidance, leaving the rest to your own judgment and sense of duty.

1. All statistics should be obtained from such sources as can be relied upon. Their value will depend upon their accuracy and authenticity. All statements, not based upon actual data, should be free from prejudice and exaggeration.

2. In your preliminary report, a brief historical review of the origin of gold and silver mining on the Pacific Coast would be interesting in connection with a statement of the present condition of the country, as tending to show the progress of settlement and civilization.

3. The geological formation of the great mineral belts and the general characteristics of the placer diggings and quartz ledges, should be given in a concise form.

4. The different systems of mining in operation since 1848, showing the machinery used, the various processes of reducing ores, the per centage of waste and the net profits.

5. The population engaged in mining, exclusively and in part; the capital and labor employed; the value of improvements; the number of mills and steam engines in operation; the yield of the mines worked; the average of dividends and average of losses in all the operations of mining.

6. The proportion of agricultural and mineral lands in each district; the quantity of woodland, facilities of obtaining fuel, number and extent of streams and water privileges.

7. Salt beds, deposits of soda and borax, and all the valuable mineral deposits.

8. The altitude, character of the climate, mode and cost of living, cost of all kinds of material, cost of labor, etc.

9. The population of the various mining towns; the number of banks and banking institutions in them; the modes of assaying, melting and refining bullion; the charges upon the same for transportation and insurance.

10. Facilities in the way of communication, postal and telegraphic lines; stage routes in operation; cost of travel; probable benefits likely to result from the construction of the Pacific Railroad and its proposed branches.

11. The necessity for assay offices and public depositories; what financial facilities may tend to develop the country, and enhance its products.

12. Copies of all local mining laws and customs now regulating the holding and working of claims.

13. The number of ledges opened and the number claimed; the character of the soil, and its adaptation to the support of a large population.

Upon all these points it is very desirable that we should possess reliable information. Whatever tends to develop the vast resources of our new States and Territories, must add to the wealth of the whole country.

I am extremely solicitous that the information collected should be ample and authentic.

Trusting that you may be enabled to make such a report as will be of great public utility, and at the same time promote the interests of the miners to whose industry and energy so much is due,

I am, very respectfully, your obedient servant,
(Signed.) H. McCulloch,

Secretary of the Treasury.

All communications with regard to the commission should be addressed to J. Ross Browne, Special Commissioner on Mining Statistics, San Francisco, Cal.

[Reported for the Mining and Scientific Press.]

California Academy of Natural Sciences.

REGULAR MEETING, Monday, Sept. 3, 1866.

President in the Chair.

Thirteen members present.

Minutes of previous meeting read and approved.

Mr. John Swett was elected a resident member, and Messrs. John Spier, B. K. Norton, and B. P. Avery were nominated for resident membership.

Donations to the Library.—From Dr. F. Mueller many valuable publications upon the Botany of Australia.

Donations to the Cabinet.—Two specimens of Fishes from Dr. Kellogg and Dr. Behr. Specimen of Fungus, *Polyporus ignarius*, from Dr. Kellogg.

Dr. Kellogg called the attention of the Academy to the remarkable specimen of Fungus presented by him, *Polyporus ignarius*, which was found growing upon the Bay tree, *Oreodaphne Californica*; and gave a very interesting description of Fungi in general; alluding particularly to the destructive effect of many species, some producing the dry rot in ships, others destroying buildings, producing the disintegration of mortar in masonry, and seriously affecting the health of, or destroying animal life.

Dr. Kellogg also remarked the use of some species of Fungi for food, particularly by the natives of Australia, who regard them with especial favor for that purpose. The rapid growth and poisonous effect of certain species of Fungi were mentioned, also the use made of some species in the arts.

Professor A. Wood, who has recently returned from a botanical exploration of Oregon, being present as a visitor, was invited to speak, and gave the following very interesting narrative of the recent ascent of Mount Hood, by himself and a party of gentlemen:

On the 20th August last, in company with Dr. Atkinson, of Portland, and the Rev. J. Deardorff, of Walla Walla, and three others, I stood upon the summit of Mount Hood in Oregon. From our last camp on the summit of the Cascade Range to this point, the summit of Mount Hood is eleven miles of constant and wearying ascent, at angles about as follows: Five miles in the first, 12 to 15°; two miles to eternal snow, 25 to 30°; one and a half miles to the gap in the rim of the crater, about 45°; the remaining ascent traversing the ancient crater, nearly or quite 60°! The day was cloudless; a strong, warm wind from the southeast softened the surface of the snow and favored our ascent, although it gave us much anxiety lest it should loosen some of the tremendous acclivities of snow and overhanging drifts from above us.

Starting from camp at daylight, on horseback four miles, we arrived at the top at a quarter past two P. M., in nine and a half hours.

Our apparatus for measuring the heights con-

sisted of two barometers (aneroid), a thermometer, a tin cup and spirit lamp. Both barometers failed us, the index ceasing to turn after something more than a complete revolution on the dial. They were not made for such heights. But we made good use of our thermometer.

The ascent was exceedingly difficult, and not without danger. The long summer heat had undermined the snows, causing their surface to conform more to the ruggedness of the mountains, and the slides had opened chasms of invisible depths across our path. We looked down into several of these chasms and saw that the massive walls below consisted of solid, blue ice, and terminated at length in the blackness of darkness. We could hear the noise of running water, apparently in torrents. One of these chasms was unavoidable—and must be crossed. Its transverse length was nearly a mile, and its width from ten to one hundred feet. By the aid of a rope, forty-five yards in length, and five pike-poles, each eight feet, we crossed (of course at the narrowest place), and afterward by ropes and poles, tugging, ponting, dizzy, we dragged ourselves up to the terrific crest of this Mountain Monarch.

The summit area is of very limited dimensions—a crescent in shape, half a mile in length, and three to forty or fifty feet in width. It is a fearful place, as it is the imminent brow of a precipice on the north, sheer down not less than a vertical mile of bare columnar rock!

This height is lifted so far above all other heights (except the four distant snow-clad peaks to the north and Mount Jefferson to the south) that the country beneath seemed depressed to a uniform level, and the horizon retreated to the distance of more than two hundred miles, including nearly all Oregon and Washington Territory. The sublimity and grandeur of that view I must leave to the imagination of the reader. A cañon of enormous depth plunges down along the southeast flank, and is filled in part by a glacier evidently in motion, and having below a very abrupt termination. Terminal and lateral moraines mark its course, and a torrent of water issues from beneath. While we delayed here, an avalanche of rocks, an immense mass, started by the wind, thundered down the left wall of this cañon several thousand feet, and its track was marked by a trail of white smoke.

On the west side of the ancient crater, at the base of a vast craggy pinnacle of rocks (a portion of the ancient rim of the crater), is still an open abyss, whence issue constantly volumes of a strongly sulphurous smoke. That there is also heat there is evident from the immense depression of the snow about this place—depressed not less than a thousand feet below the snows which fill to the brim other portions of the ancient crater.

As I have already stated, we found our barometers useless in these vast heights, and were reduced to the use of the thermometer alone. By this we learned the boiling point of water at four several stations, as follows: At the camp, the summit of the Cascade Range, it stood in boiling water at 204° Fah. At the upper verge of the forest, it indicated 195½°. At the highest reach of all apparent vegetation, 192°; and finally at the summit, where, after the most persevering and determined efforts (on account of the violence of the wind), we at length, by means of a spirit lamp, changed a portion of snow to a cup of boiling water, the mercury stood firm in the cup at 180°! These several results being changed to feet of elevation, according to the rule universally approved in such cases, indicate heights as follows, viz: At the summit of the Cascade Range, and foot of Mt. Hood proper, 4,400 feet; at the limit of forest trees, about 9,000 feet; at the highest limit of vegetation, 11,000 feet; at the summit of the mountain, 17,600 feet.

We earnestly hope that these results may be hereafter tested by the barometer; and by triangulation. Until then, we must adopt the estimate here made, as the height of that sublime peak, and accord to Mount Hood the distinction of being the highest land in the United States, if not the highest upon the North American continent.

Adjourned.

T. H. BLOOMER, Rec. Sec'y.

CHANGE IN PROFESSORSHIPS.—Doctor J. Newton Brown has resigned the Professorship of Anatomy in the Toland Medical College. The Faculty have chosen Dr. L. C. Lane, late Professor of the Institutes of Medicine, to fill the vacancy. Dr. Robert Oxland has also resigned the Professorship of Chemistry, and Dr. Thomas Price has been elected to occupy that Chair.

THE YUBA RAILROAD.—Work upon this road is being rapidly pushed ahead. The cars are already running on the north side of Bear river, and the track is nearly all graded to the Yuba. This road will be vigorously pushed on to Oregon.

NEW PATENTS AND INVENTIONS.

Under this heading we shall mention, from week to week, as occasion may demand, new and important inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

NEW INVENTIONS.

GRAIN ELEVATOR.—It is worthy of note to observe that California inventors are turning their attention to improvement in agricultural machinery. We have already noticed quite a number of valuable inventions in this direction. W. D. Overbiser, of San Joaquin county, has recently devised an important application of horse power to the handling of grain, a full description of which we append from the *Stockton Independent*. The invention appears to be eminently practical, and is one which we should think must come into general use both here and in the Atlantic States:

It consists of a stout pole or scantling, five or six inches in diameter and from thirty to thirty-five feet long, with a cross head three feet long securely fastened to it, and with an iron pin and collar at the lower end of the pole fitting into an iron socket on the foot. The whole is kept in position by four guy ropes fastened in the usual manner. There is a large single pulley fastened to a stake driven in the ground about seventy-five feet from the derrick; two single pulleys are fastened at the foot of the derrick and two similar ones attached to the cross head. Through these pulleys is a rope to which is attached two of Myer's Patent Hay Forks or Elevators. On the ground are two frames, with rollers to prevent the rope from rubbing too much on the ground. The continuous rope passed through the pulleys has both ends terminate on the stack, and each end of the rope is attached to one of the patent elevators, with a man to handle and guide each. A horse is then attached to the rope near the pulley on the ground seventy-five feet from the foot of the derrick, and upon drawing towards the stack the fork on one side of the derrick is loaded, elevated and moved to the place where the load is required, and then, by a slight pull of a string discharged—the load falling upon the table of the threshing machine. The other fork, in the meantime, is drawn back and made ready for another load, when the horse is turned round and, pulling the contrary way, hauls the newly loaded fork up to the derrick, when it is discharged as before. By this means, in three days and a half, two men supplied Overbiser & Fairchild's 36-inch cylinder thrasher, with sufficient material from the stack to yield 4,000 bushels of wheat. They are now threshing at Mr. Shafer's, near Waterloo, where this grand new labor-saving apparatus can be seen in operation. It saves the labor of eight or ten men—a result which will make every farmer's wife utter expressions of gratitude to the inventor, as not only on the field but likewise in the kitchen will its benefits be experienced.

A USEFUL INVENTION.—Mr. M. M. Cook, hose manufacturer of this city, has invented a very ingenious contrivance for leaky or burst hose, the application of which cannot fail of being of great benefit to the Fire Department.

PATENTS RECENTLY ISSUED.

QUARTZ CRUSHER.—S. B. Pike, assignor to himself and Robert H. Vance, San Francisco, Cal.: 1 claim, 1st, The use of the guides, L L, when arranged as described to insure the passage of all the ore under the rollers, substantially as herein specified and for the purpose set forth. 2d, The employment of the horizontal bar, H, hub, I, and slotted boxes, K K, or their equivalents, for the purpose of allowing the rollers, F F, to accommodate themselves to the varying amount of ore on the revolving plate, B, and die, C, substantially as described, and for the purpose as set forth. 3d, The gutter, D, operated by the binders, Y Y, and keys, X X, in combination with the revolving plate, B, rollers, F F, guides, L L, annular die, C, and scraper, when constructed to operate in the manner specified and for the purposes set forth. This machine was illustrated in the *MINING AND SCIENTIFIC PRESS* of December 2d, 1866.

TEA-POT.—Robert Carter, San Francisco, Cal.: 1 claim, 1st, The bottom, N, N, figure 2, of the inner case, H, figure 2, being formed convex toward E, figures 1 and 2, the bottom of the outer case, D, figures 1 and 2, for preventing the violent ebullition of the water contained in K, K, K, figure 2, when boiling, as would ensue if the bottom of H, figure 2, was flat. 2d, And without confining myself to any particular shape, size, or material, I claim the general combination of the two cases, with their surroundings and appurtenances, as in this specification shown, for the purposes described, and in the manner substantially herein set forth.

APPARATUS FOR TREATING ORES.—J. C. Coult and J. Roach, San Francisco, Cal.: We claim, 1st, The pipe, C, connecting with a furnace and having a wide opening entering the condenser, E, thereby imparting a greater distribution of the fumes as they enter said condenser or water-tank, and equally spreading the fumes over the water, substantially as described and for the purposes set forth. 2d, The tank, B, with an inclined bottom, and the partitions, b, b, b, in the inverted tank or cover of the same, and the adjusting screws, F, F, attached thereto, substantially as described and for the purposes set forth. 3d, The perforated diaphragm, G, having sufficient openings to equal the opening of the pipe, C, where it enters the condenser, E, as before stated, likewise the water bottom, G, and G, over which the fumes collect and are drawn into a fan or pump, thereby bringing the fumes again in contact with the water for a long distance and extracting all that it may be desirable to collect before allowing an escape into the chimney, substantially as described and for the purposes set forth.

SEWING MACHINE.—Joseph C. Tucker, San Francisco, Cal. I claim, 1st, The combination of a rocking perforating needle-carrying arm with one or more adjustable perforating needle-carrying arms, substantially as described; 2d, The combination of the lower thread-carrying looper, working in fixed bearings, with one or more loopers, the bearings of which are capable of being adjusted, substantially and for the purpose set forth; 3d, The combination with the rocking arm of a sewing machine, provided with a perforating needle, of one or more adjustable needle-carrying arms above the table, and a looper working in fixed bearings below the table, and one or more loopers in adjustable bearings for making parallel lines of stitching, substantially as described; 4th, In combination with the rocking arm of a sewing machine, carrying a perforating needle and provided with one or more adjustable needle-carrying arms, I claim a stationary arm provided with one presser held in fixed bearings and one or more in adjustable bearings, substantially as described.

QUARTZ MILL.—Albert Moore, San Francisco, Cal.: 1st, In combination with the radial feeding furrows, B, B, B, I claim the plain surface beyond the ends of the furrows, substantially as described for the purposes set forth. 2d, The manner of breaking the joints in constructing and laying the shoes and dies, so that no continuous straight lines shall be employed from the feed center of the miller to its circumference, substantially as described and for the purpose set forth.

A NEW WATER FAUCET.—Mr. C. H. Stone, of this city, has invented a faucet or water cock, which appears to be quite novel in its construction. It is described as follows: "The novelty consists in the plug being conical, with the butt end downwards, and the application of hydrostatic pressure to the base of the cone, forcing it upwards into the chamber, and holding it there with a pressure equal to the resistance. At the back of the plug is a small groove, which allows water to pass downwards into a brass cup, which is screwed on to the lower part of the faucet, and covers the end of the plug. At the foot of the plug is a small spiral spring resting on the cup sufficiently strong to hold the plug tightly in its place, when there is no liquid bearing it down. When in use, whatever liquid is pressing upon the plug finds its way down the small groove into the cup and presses the plug with as much force upwards from the cup as it does downwards, whether the tap is open or shut."

NEW AMALGAMATOR.—We published an item some time ago, in relation to a new amalgamator then being made at Sacramento. We notice by the papers of that city that the machine has been finished and tested at the foundry of Goss & Lombard. The patentees, Senatz & Knowlton, who have been experimenting on a small scale for some months, think their new machine will save more gold from tailings than any now in use. It consists of two slaking tables, each twenty-six inches wide and four feet long. These tables are worked with a sliding motion, and to each is attached a stationary frame, from which project downward, nearly touching the bottom of the table, a large number of iron teeth or riffles. The tailings, after being brought in contact with the quicksilver of the first table are carried along with the stream of water to the second, which is also supplied with quicksilver. Out of 300 pounds of tailings, taken at random from the mill site of the Ceresus Company, near Auburn, in Placer county, about a dollar's worth of gold was extracted. If the machines will extract gold at the same rate, from the tailings of the quartz mills now running in various parts of the State, the invention will prove valuable.

CUTTER FOR WOOD-PLANING MACHINES.—Charles Livingston, Redwood City, Cal.: I claim the arrangement of the cutters, C and G, upon a suitable cutter-head, having a wedge-

shaped center-piece, B, substantially as and for the purpose herein described and set forth.

GOLD SEPARATOR.—Chas. F. Testmon, Portland, Oregon: I claim three things, the first is the process of drying dirt in the boxes, a, a, and b, b, by means of the fire, e; the second is the application of the springs, o, o, to the roller, m; and the third is the method of constructing the amalgamating pans, r, r, and procuring thereof the gold dust in the quicksilver pockets by means of the continued revolution of the stirrer, q, q.

Patents can be obtained for citizens on this Coast, through the *MINING AND SCIENTIFIC PRESS* PATENT AGENCY, in one-half the time it takes to operate through Eastern agents. From our familiarity with the subject of no California inventions, and the benefit arising from no explanations, we are prepared to present claims with greater accuracy than could reasonably be expected of distant agents. DEWEY & CO., Patent Agents, 505 Clay street, San Francisco.

New York Metal Market.

We condense the following from Winterhoff's New York Metal Circular of August 3d, 1866, as follows:

The modified Tariff bill does not affect metals. In the beginning of July, while the fate of the Tariff was uncertain, a little speculation prevailed, but immediately afterwards business became very dull. The successful operation of the Atlantic Telegraph tends also for the moment to unsettle matters. The autumn trade has not yet commenced, but it promises to be satisfactory, as the prospect for the grain and cotton crops have improved.

Tin.—A moderate demand for Straits advanced the price from 18¾ to 19½ and 20c. Banca is quoted 20@20½c; English, 19½c.—all gold. The importations for July amount to 3,300 slabs Straits and 20 tons English. Present stock, 23,600 slabs against 6,050 slabs, on the 1st of August, 1865; 15,700 in 1864, and 21,800 in 1863.

Spelter.—With the prospect of peace in Germany, the price of foreign has declined again, and may be quoted at 6¾ to 7c. for Silesian and Stolberg. The demand for consumption seems very small. The importation for July was 125 tons. The domestic article appears only in small quantities, and the price is nominal—11½ to 12c. currency.

Copper.—The non-passage of the Tariff created a good deal of disappointment among the Lake companies, and they were eager to sell. The price has declined to 31c. for all kinds. This low rate attracted attention, and about a million of pounds were sold on speculation. It may be quoted at 31 to 32c., with a steady demand. Several parcels of foreign copper, lately imported, are held out of the market.

Lead.—In the first two weeks of July we had a speculative demand, based upon the war in Europe and the probable higher duty, and 2,000 tons changed hands at an advance of ¾ to ½ cent. Ordinary Spanish was sold at 7¼ to 7½c., and better kinds of English at 7½c. With the prospect of peace a few forced sales of common German have been made at 6¾c; ordinary brands at 6½ to 7c; English, suitable for white lead, is held a great deal higher. The importations for July amounted to 820 tons, and the deliveries for consumption to 1,100 tons. The stock is 3,800 tons, against 4,300 tons on the 1st of August, 1865; 9,000 tons on the same date, 1864, and 9,100 tons on the same date, 1863.

Gold.—Declined during the month from 154 to 147 per cent.

STRANGERS visiting San Francisco can use the Baglar Proof Vault of the CALIFORNIA BUILDING, LOAN AND SAVINGS BANK, California street (one door from Sansome street), for the temporary deposit of Gold Dust, Coins, Bonds, etc., at a small monthly rent, according to the value of the property deposited, for which the Company will be accountable.

AN IMPORTANT DISCOVERY IN SURGERY—INSTANTANEOUS ARREST OF HEMORRHAGE.—Dr. Richardson, who succeeded in perfecting the means of causing local anesthesia, by means of an ingenious instrument for dispensing the fluid over the affected part in a very fine spray, under which surgical operations can be done without pain to the patient, has made an application of the same proceeding to the immediate and total arrest of hemorrhage. He had observed in the first instance, that chilling in a high degree, as by the anesthetic spray, prevents all venous and capillary and even arterial hemorrhage. He was therefore led to think that if the ether used for the first purpose, could be supplemented by a styptic (any substance possessing a high astringent power), which would spray evenly with it, a highly important desideratum in surgical practice, would be supplied. Accordingly he devised a

Zy-o-Styptic Ether Spray.—It consists of a solution of ether charged to saturation at a low temperature with tannin, and afterward with zlyoidioe. This compound ran easily through the spray tube and produced good local anesthesia. In order to test the styptic characteristic of this preparation, he directed the spray upon a mass of previously defibrinated blood. In five seconds the whole mass of it was thoroughly solidified.

But even this effect was slow compared with what took place in blood newly drawn containing fibrine. In this case it coagulated in a second.

This styptic ether can not only be applied with certain effect to open wounds, but as successfully in the case of those alarming medical events, hemorrhages of the uterus.

This styptic ether will become of standard service to the medical practitioner, to surgeons on board ship, and to army surgeons. On the battle-field and under the instruction of a surgeon, it could be used by an orderly, so as to instantaneously arrest hemorrhage.

A PORTLAND tax bill of the date of 1834, scorched and partly burned, was picked up in Brunswick after the late fire in the former city, having been blown twenty-seven miles from Portland to Brunswick.

PREFER solid sense to wit; never study to be diverting without being useful; let no jest intrude upon good manners, nor say anything that may offend modesty.

Machinists and Foundries.

PALMER, KNOX & CO.,
Golden State Iron Works,
Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF
MACHINERY,
STEAM ENGINES AND QUARTZ MILLS
DUNBAR'S IMPROVED

Self-Adjusting Piston Packing.
Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S
NEW GRINDER AND AMALGAMATOR
HEPBURN & PETERSON'S
AMALGAMATOR AND SEPARATOR,
Tyler's Improved Water Wheel.

Giving the greatest power, at lower cost, than any Wheel in use. There are over 1,500 running, giving universal satisfaction.

KNOX'S AMALGAMATORS,
WITH PALMER'S PATENT STEAM CHEST,
Superior for working either Gold or Silver Ores.
Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past eight years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver.

Notice to Miners,
Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG,
8v13 1y Stove Store, No. 125 Clay street, below Davis.

T. G. DURNING. J. F. FISHER.

PACIFIC FILE FACTORY,
No. 53 Beale Street,
Between Market and Mission streets, San Francisco.

FILES RECUT AND WARRANTED AS GOOD AS NEW, or no charge. The only establishment in the State. We also manufacture Reamer and Taper Sections.
8v12 1y **DURNING & FISHER, Prop'rs.**

LEWIS COFFEY & RISON,
Steam Boiler & Sheet Iron Works.

THE only exclusively Boiler Making establishment in the Pacific Coast owned and conducted by Practical Boiler Makers. All orders for New Work and the repairing of Old Work, executed as ordered, and warranted as to quality. Old Stand, corner of Bush and Market streets, opposite Oriental Hotel, San Francisco.

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mill Mining Pumps, all kinds of Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, Serew and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

ENGINES. Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

BOILERS. Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

PUMPS. The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's Improved flat bottom pan, Beldin's pan, Vetch's tub, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

H. J. BOOTH. GEO. W. PRESCOTT. IRVING M. SCOTT.

H. J. BOOTH & CO.

Vulcan Iron Works Company

[ESTABLISHED 1850.]

First, Natoma and Fremont Streets.

IRON FOUNDERS,
Steam Engine and Locomotive
BUILDERS,

Boiler Makers, and Workers in Sheet Iron, Brass and Copper.

These Works have lately been increased by the addition of new shops on Fremont Street, doubling the capacity of the original establishment. Their facilities for turning out machinery promptly and efficiently, are now unequalled in the State. Their Boiler Works have also been enlarged correspondingly.

The Company are prepared to execute orders for all classes of Machinery and Boiler Work, such as

Mining, Steamship, and Steamboat Machinery,

Railroad Machinery, Flouring Mills, Quartz Mills, Car Trucks, Sugar Mills, Car Wheels, Saw Mills, Hoistings and Irons; and

Manufacturing Machinery of Every Kind.

Sole Manufacturers of

Pacific Forge Company.

FORGING AND IRON WORK.

THE PACIFIC FORGE COMPANY HAVE JUST ERRECTED, in this city, on Fourteenth street, near the machine shop of the San Jose Railroad, a large establishment for the purpose of forging and working in wrought iron. Our hammer is the largest upon this coast, and we are prepared to manufacture, at short notice all kinds of heavy forgings, car axles, shafts, steamboat cranks, piston-rods, wagon axles, and other similar work. This is the first general shop of the kind erected in this State, and we solicit the patronage of the public. All orders executed at reasonable rates, and with promptness and satisfaction. 19v12 3m

The Metric or Metrical System.

This system is now adopted in nearly every scientific writing, whether it be in a periodical or book. It is compulsory in many, and used in all the continental European nations, and it is legalized by law in England and the United States. The bill introduced in Congress by the Hon. John A. Kasson, M. C. of Iowa, and which is now a law, looks to the early expulsion of all other weights and measures; and every one who remembers his schoolboy troubles between Troy weight and apothecary's weight and avoirdupois weight, and between dry measure and beer measure and wine measure, and the general perplexity of the tables, will be thankful it is so. But we will have a duty to perform. Old and young must make themselves thoroughly acquainted with the system. It is exceedingly easy of comprehension. It is wholly based upon the meter, a measure of length equal to 39.37 inches. The measure of capacity is the liter or contents of a cubic decimeter. The measure of weight is the gram, which is the weight of a cubic centimeter of distilled water. The measure area or superficies is the are, which is one hundred square metres. These four—the meter, the liter, the gram and the are—are the units of the system, and are equivalent to our present weights and measures as follows: The meter, as already stated, is 39.37 inches long, the liter contains 1.0567 wine quarts; the gram weighs 15.432 grains avoirdupois, and the are contains 119.6 square yards. The system is decimal, and quoting from an Atlantic contemporary, "It can be fully mastered and learned by any one in thirty minutes. First, it is necessary to learn the meaning of the four units—

Meter, the unit of length.
Liter, the unit of capacity.
Gram, the unit of weight.
Are, the unit of area.

Then it is necessary to learn the meaning of four Greek and three Latin numerals as prefixes. The Greek are:

Deka 10
Hecto 100
Kilo 1,000
Myria 10,000

The Latin are:

Deci One-tenth.
Centi One-hundredth.
Milli One-thousandth.

This is the whole table. In these eleven words is comprised all that man or child need learn. Everything else follows of its own accord. Kilometer, 1,000 meters; Centi-meter, the one-hundredth of a meter; Myriagram, 10,000 grams; Milligram, the one-thousandth of a gram; Hecto-liter, 100 liters; Deci-liter, the one-tenth of a liter; Hecto-are, 100 ares; Centi-are, the one-hundredth of an are, etc., etc. After the units and prefixes are known, all that is required is to put them together so as to designate the sun, either rising or descending, of the unit you wish to express.

COLORED STARCH is the latest and greatest novelty of the day in Paris. It is made in pink, buff, the new mauve, and a delicate green, and blue will soon be produced. Any article starched with the new preparation is completely colored—dyed, we should have said, but as it washes out, and the garment that was pink to-day may be green to-morrow, and buff afterwards, we can hardly say "dyed." It is intended especially for those bright but treacherously colored muslins that are costly, wash out and perplex their owners. If the pattern has been mauve, they only need the mauve starch; if green, green starch; and they can be rendered one even and pretty shade, thus becoming not only wearable again, but very stylish. White anti-macassars, or lace curtains, may also be colored in the same way, and infinite variety afforded.

Rheumatism!!

READ IT! READ IT!!

SACRAMENTO, April 16 h. 1886.
H. ROWMAN—DEAR SIR: THIS IS THE FIRST WRITING I have done in two years, and it affords me great pleasure to be able to use my pen in the service of those who are suffering, as I have suffered, by stating the following facts:

I have for two years and upwards been afflicted with CHRONIC RHEUMATISM, and until a few weeks ago I have never found anything that afforded me any relief. For three months of the time I was unable to feed myself, and for the last five months my arms have been so bent that I have not been able to dress myself. I was five months at the Warm Springs at San Luis Obispo, and three months at a Hydrophatic Institute in Stockton, and I have been under the care of six different physicians, in the vain hope of relief. About four weeks ago I was induced by a person who had been cured by it to try a bottle of RICHARD'S REMEDY FOR RHEUMATISM, and in less than twelve hours I experienced great relief. In a few days I was enabled to straighten out my arms, and I have been getting better and gaining in strength and flesh ever since. I have now the complete use of all my limbs, and for the first time in two years, I am out of pain. I do feel for those who suffer as I have suffered, and if they will take my advice, they will lose no time in giving the REMEDY A TRIAL. Yours truly, GEORGE TAYLOR.

RICHARD'S REMEDY is for sale by
H. ROWMAN,
Druggist, Sacramento, 2v12
Price, \$2.50 per Bottle.

COPPERAS! COPPERAS!

BENJAMIN BRADY,
103 California street,
Southwest corner of Davis, up-stairs. 2v12

Capitalists, Attention!

QUARTZ MILL & MINING PROPERTY
FOR SALE
In Nevada County.

A NEW 8-STAMP QUARTZ MILL, 7 LEDGES AND 640 acres heavily timbered Land, near Eureka, Nevada County, are now offered for sale. The Mill is run by steam power, and is in complete order for business. The ledges, which form the principal value of this property, are all large and well-defined, but require a further outlay of capital, in order to make them remunerative. For the lack of means to properly develop these claims, the present owners are disposed to sell the same for a reasonable price. Capitalists wishing to engage in mining will find this a splendid opportunity to purchase a property that will bear high scrutiny, and offers superior inducements as an investment.

For address and further information, inquire of the Publishers of the MINING AND SCIENTIFIC PRESS, 505 Clay Street, San Francisco. 2v12

HAYWARD, COLEMAN & CO.,

IMPORTERS AND REFINERS

SPIRITS OF TURPENTINE & ALCOHOL

NOTE.—We would specially call the attention of Mill owners and Engineers to our superior PARAFFINE OIL, which we manufacture from the California Petroleum. This Oil will not gum. Machinery thoroughly cleaned and lubricated with it will not heat, and after remaining at rest, can be started without cleaning off.
A sample can of our Paraffine Oil will be forwarded on application to us, as we desire a fair and impartial trial.

Lamps and Lamp Stock!

An elegant and complete assortment on hand. 8v13-3m19 414 Front street, San Francisco.

THE CALIFORNIA

Aerated or Unfermented
BREAD COMPANY.

Bakery on Folsom Street,
Between Tenth and Eleventh.....SAN FRANCISCO

MESSRS. TAGGART, BULKLEY & DUFF, HAVING ASSOCIATED themselves in partnership, are happy in announcing to the public that they are now prepared, and would respectfully solicit, all orders for his truly wholesome and cleanly Bread. We have a sufficient number of delivery wagons at our bakery to guarantee to all who may favor us with their patronage a prompt delivery of fresh bread daily, Sundays excepted.

Through the kindness of the gentlemen of the following named firms, we are privileged to keep an order box for the conveyance of all orders for the bakery so that they may reach our earliest attention:
Order box at C. J. Hawley & Co.'s Grocery, corner Second and Jessie streets; Rowland & Walker, 614 Clay street; Plum's Carpet Store, Montgomery street, opposite Lick House; G. W. Clark, Paper Hanging, corner Sansome and Clay streets. Orders handed to any of the route-men like wise. We expect soon to be prepared to supply Pastry, likewise the Boston Brown Bread, and Beans of the first quality. Due notice will be given.

The present Company is entirely independent of the former California Unfermented Bread Company, neither of them having been in any way connected with that company.

We would cordially invite the public to make a visit to our new bakery. 4v13-3m 8v13 BULKLEY, Business Partner.

METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, between Third and Fourth,
SAN FRANCISCO.

THE PROPRIETORS are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyrites, and the so-called "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well equipped Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

Zadig Ph.	35	8	8.00

And in accordance with law, and an order of the Board
 of Trustees, made on the thirty-first day of July, 1886, so
 many shares of each parcel of said stock as may be neces-
 sary, will be sold at public auction, by Maurice Dore & Co.,
 at No. 327 Montgomery street, San Francisco, Cal., on
 Tuesday the twenty-fifth day of September, 1886, at the hour
 of 1 o'clock, P. M. of said day, to pay said delinquent as-
 sessment thereon, together with costs of advertising and
 expenses of sale.

R. WEGENER, Secretary.
 Office 445 Montgomery street, San Francisco, Cal. 8v8

Kentucky Copper Mining Company, Mine Fe-
lix District, Calaveras County, California.

Notice.—There are delinquent, upon the following de-
 scribed stock, on account of assessment levied on the
 second day of August, 1886, the several amounts set op-
 posite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.

And in accordance with law, and an order of the Board
 of Trustees, made on the second day of August, 1886, so
 many shares of each parcel of said stock as may be neces-
 sary, will be sold at public auction, at the salesrooms of
 Cobb & Sinton, 407 California street, on the twenty-sixth
 day of September, 1886, at the hour of 12 o'clock, M. of said
 day, to pay said delinquent assessment thereon, together
 with costs of advertising and expenses of sale.

J. A. BAUER, Secretary.
 Office, 644 Washington street, San Francisco, Cal. 8v8

Important to Californians.—Many inventors have
 lately had their claims for Patents seriously (and in some
 cases fatally) delayed by the unqualification of agents who
 have not complied with the Government license and revenue
 laws, as well as other new and imperative regulations.
 These discrepancies, although arising from the inexperience
 of honest agents, are now the less dangerous to applicants
 for patents, whose safest course is to trust their business
 with one but active and experienced solicitor. The Min-
 ing and Scientific Press Patent Agency has strictly com-
 plied with the requisitions of the Department, and properly
 filed all necessary papers as Claim Agents.

Simpson Mining and Milling Company, Mokel-

unne and Excelsior District, Alpine county, California.

Notice.—There are delinquent upon the following de-
 scribed stock, on account of assessment levied on the third
 day of August, 1886, the several amounts set opposite the
 names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
T. Cunningham	not issued	100	\$20.00
I. L. Simpson	not issued	100	30.00
Charles Smith	not issued	100	30.00

And in accordance with law and an order of the Board of
 Trustees, may on the third day of August, 1886, so many
 shares of each parcel of said stock as may be necessary,
 will be sold at public auction, at the office of the Company,
 southwest corner of Front and Jackson streets, up stairs,
 San Francisco, California, on the twenty-fourth day of Sep-
 tember, 1886, at the hour of 12 o'clock, noon, of said day,
 to pay said delinquent assessment thereon, together with
 costs of advertising and expenses of sale.

T. B. BIGELOW, Secretary.
 Office, southwest corner of Front and Jackson streets, up
 stairs, San Francisco, Cal. of California. sep3

White and Marphy Gold and Silver Mining

Company, Virginia District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board
 of Trustees of said Company, held on the fourth day of
 September, 1886, an assessment of one (\$2.25) dollar and
 twenty-five cents per share was levied upon the capital
 stock of said Company, payable immediately, in United
 States gold coin, to the Secretary, at the office of the Com-
 pany.

Any stock upon which said assessment shall remain un-
 paid on the eleventh day of October, 1886, shall be deemed
 delinquent, and will be duly advertised for sale at public
 auction, and unless payment shall be made before, will be
 sold on Thursday, the first day of November, 1886, to pay
 the delinquent assessment, together with costs of adver-
 tising and expenses of sale.

JOSEPH P. NOURSE

and thorough in transacting sales of delinquent stock. Besides every kind of auction business, this firm will pay special attention to the purchase and sale of real estate in Oakland.

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; a, Dies; c, Shoes, and o, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan when properly constructed, are respectively 177, 118 and 132.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes direct from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been furnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the **PACIFIC FOUNDRY,** San Francisco.

LEFFEL'S American Double Turbine

THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given unusual satisfaction whenever used, is now for sale by **KNAPP & GRANT,** 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These Wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 600 feet fall. Let us know how much water you have either in mill-races or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to **KNAPP & GRANT,** San Francisco.

Leffel's Lever Jacks,

For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks, for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind. For sale by **KNAPP & GRANT,** San Francisco.

PAGE'S PATENT FOR RAISING SUNKEN VESSELS!

SHIPPING AND INSURANCE COMPANIES, AND other parties upon this coast or in the Atlantic States, having occasion to avail themselves of this invention, which has been tried and proved a success, will please address, for the present, **JOSEPH H. PAGE,** San Francisco or at the office of the **Mining and Scientific Press,** 8v13 **AUSTIN Z. PAGE,** Patentee.

Book Printing should be considered and treated as one of the higher branches of the "Art of Arts," and its execution entrusted only to experienced and intelligent workmen. Strict attention will be given to all orders for BOOK AND PAMPHLET PRINTING entrusted to the Mining and Scientific Press Job Office.

BAUX & GUIOD'S Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the **FIRST PREMIUM** at the San Francisco Mechanics' Fair for 1884, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine Scientific Knowledge with Practical Experience, these pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgamators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by **BAUX & GUIOD'S** Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping. As it is constructed to work continuously, the complete thoroughness of the separation of the rock from the metals and the triding power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Grail's Gravel Cement Works, Nevada county; Waltham's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Hough & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address **J. B. BAUX,** Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6d1f

It tells us truly the Minute, Hour, Day of the Week and Day of the Month.

HORTON'S PATENT CALENDAR CLOCK!

MANUFACTURED BY THE

ITHACA CALENDAR CLOCK COMPANY,

Ithaca, N. Y., and for sale by

W. J. EGBERT, Agent,

At Job M. SEAMAN & Co's, 631 WASHINGTON STREET, San Francisco.

THIS TIME PIECE costs but a trifle more than any other good clock, and is just the article for every well-regulated business house, office, saloon, or, in fact, any place where a handsome, perfect time-keeper is duly appreciated. The Clock has two dials, the first being the same as an ordinary clock; the second has but one pointer, and shows the day of the week, the month and day of the month. It is arranged to mark the days in leap years with equal regularity. It is an eight-day piece, and runs from year to year without change. It can be examined at the Office of the **Mining and Scientific Press,** 2v13p16-1f

To Ditchmen, Millmen and Others Requiring IRON PIPE.

M. R. ROSE, CORNER OF 9TH AND K STREETS, Sacramento City, has facilities unsurpassed on this coast for the manufacture of IRON PIPE of every description. He also has on hand a deep well FORCE PUMP of his own invention and manufacture, well adapted for oil wells. His tools being portable, pipe can be manufactured on the ground. 19v12

EXCELSIOR PUMP!

HOOKER'S PATENT!

THIS DOUBLE-ACTING SUCTION AND FORCE PUMP CHALLENGES COMPETITION for simplicity, durability and power, and will work at any depth. The pistons for Mining Pumps are packed with hemp. The valves are reached by simply removing the "bonnets," thereby avoiding the trouble of raising a long column of pipe. They will raise as much water as TWICE their size of single-acting Mining Pumps, and are sold at half the price. We have never heard of the valves in this Pump being out of order. For their many superior points they are fast replacing all other Force Pumps. Reference can be given where this Pump is working with eighteen others of different patterns, and is pronounced THE BEST, also, from some of the best miners in the State who have them in use. For manufactories, farms or domestic use, we warrant them the best and cheapest. All sizes adapted to any power or any purpose. For sale by agents throughout the State.

J. W. BRITTON & CO.,

General Agents,

120 Front street, San Francisco.

Send for Price List.

2v13 3m

STODDARD'S

CELEBRATED WATER FILTERS!

PURIFY RAIN, RIVER, OR SPRING VALLEY WATER perfectly pure and healthy. Three sizes. Price, \$12, \$16 and \$18. For sale by **S. B. STODDARD,** Corner of Battery and Pacific streets. 25v12 3m

June 23, 1886.

Union Amalgamator.

This Valuable Invention

IS FAST FINDING ITS WAY INTO GENERAL USE, NOT by means of combination of capital and influence, but on the strength of its own merits, and upon the principle that what is known to be good will be appreciated. Practical men acknowledge the **UNION PAN** to be scientific, the best, the cheapest, and most profitable. It now stands first on the list of all pans in use for the purpose of

Working Gold and Silver Ores.

It has been found that a low class of ores, also tailings from Mills, Sulphurets, etc., that will not pay to work with the common pans, may be worked with this and obtain large profits. The **UNION PAN** is manufactured in two sizes, and capable of operating upon large quantities of ore in the most efficient manner.

Parties interested in Quartz Mining, Mills, etc., will find it to their advantage to call and examine for themselves, and see its operation.

Gold and silver ores tested by regular mill process, at moderate cost, by

STRONG & CO.,

San Francisco Foundry, corner Mission and Fremont streets, where orders will receive prompt attention.

Economy in Advertising.—The **Mining and Scientific Press** is the best and most economical mining advertising medium in this city. Our terms are less than one-half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

THE VIRTUE OF BORAX.—The washerwomen of Holland and Belgium, so proverbially clean, and who get up their linen so beautifully white, use refined borax as washing powder instead of soda, in the proportion of one large handful of borax powder to about ten gallons of boiling water: they save in soda nearly one-half. All the large washing establishments adopt the same mode. For laces, cambrics, etc., an extra quantity of the powder is used, and for crinoline, requiring to be made stiff, a strong solution is necessary. Borax being a neutral salt, does not in the slightest degree injure the texture of the linen; its effect is to soften the hardest water, and therefore it should be kept on every toilet table. To the taste it is rather sweet; it is used for cleaning the hair, is an excellent dentifrice, and in hot countries is used in combination with tartaric acid and bi-carbonate of soda as a cooling beverage. Good tea cannot be made with hard water; all water may be made soft by adding a tea-spoonful of borax powder to an ordinary sized kettle of water, in which it should boil. The saving in the quantity of tea used will be at least one-fifth.

NORWEGIAN LEGEND.—Two little boys were playing by the side of a river, and they saw the Stromkari, or water spirit, sitting on the shore, and playing on his harp. Then the children called out to him, and said, "Stromkari, why do you sit here playing? There is no salvation for you." Thereupon the Stromkari fell to weeping bitterly, threw his harp away, and sank into the deep waters. When the boys returned home, they related to their father, who was a godly man, what had befallen. The father said, "You have sinned against the Stromkari; go back and comfort him, and tell him that he shall be saved." When they went back to the river, the Stromkari sat on the shore, weeping and lamenting; and the children said, "Weep not so, Stromkari, our father says that thy Redeemer also liveth." Then the Stromkari joyfully took his harp and played sweetly till sunset.

THE BOY THAT WOULD HAVE DONE IT.—When Lieut. Governor Patterson was speaker of the Legislature of one of our States, some dozen boys presented themselves for the post of messenger, as is usually at the opening of the House. He inquired their names and into their condition, in order that he might make the proper selection. He came, in the course of his selection, to a small boy about ten years old, a bright looking lad. "Well, sir, what is your name?" said he. "John Huneock, sir," replied the boy. "What, you are not the one that signed the Declaration of Independence, are you?" said the Speaker. "No, sir! but I would if I had been there," replied the lad, stretching himself to his utmost proportions. "You can be one of the messengers," said the Speaker.

ANOTHER ASTEROID.—The 87th of the group of asteroids was discovered on the night of June 16th, at Madras, India. The new planet has been named Sylvia. It can only be detected by very powerful telescopes.

J. B. CONE, BUSINESS AGENCY.—Makes private sales of Property and Business Places of every description, in the city and throughout the State; procures partners with large and small amounts of money; negotiates sales of mining property, and does a General Agency Business. Patronage solicited by mail, express, or by personal application at the office, 402 Montgomery Street, San Francisco, California. 2x11H

CAUTION!—TO WHOM IT MAY CONCERN.—The Public are hereby notified that a patent was allowed Dec. 27th, 1864, and issued June 25th, 1865, to Professor Henry Wurtz, for the use of Sodium and Amalgams thereof with quicksilver, in the extraction of precious metals from their ores. All persons using said Amalgams, or purchasing or selling Sodium or said Amalgams, for use in the treatment of gold or silver ores, are hereby cautioned that they will be subjected to the full extent of the law.

SODIUM OR MAGNETIC AMALGAM.

THE WURTZ AMALGAMATION COMPANY,
OF NEW YORK.

Assignees of letters patent granted to Prof. Henry Wurtz, the discoverer of the use of Sodium in the amalgamation of gold and silver ores, having established an agency in San Francisco, now offer to the mining community their amalgams, with full directions for their use, on the MOST LIBERAL TERMS. A large supply of the Amalgam, of any required strength, constantly on hand.

The terms and conditions upon which rights to use the process are obtainable, can be had on application to
WM. KNOX,
Agent of the Company, Union Iron Works, corner of First and Mission street, San Francisco. 5x13

8x10

THIS CUT REPRESENTS AN AMALGAMATOR and Separator that has stood the test of many years' practical working in the gold mines of California, and for nearly the same time in the silver mines of Nevada, having been introduced into the first steam mills built in the then Territory, since which time they have been successfully working against all competition.

The great advantages these Amalgamators have over any others, are—

1st. Much less Cost.

2d. They do not "flour" the mercury, and collect any that may have been "sickened" in the battery or grinders.

3d. The "sloshing" motion given to the pulp (by the revolution of the roller under the stationary frame) against the amalgamated copper plates that are fastened to the frame, and by this means catching the fine gold and mercury that will not settle.

4th. The gate in the cone, through which the pulp is discharged, from the top, and where there is the least motion, almost precluding the possibility of any granulated mercury or fine gold escaping.

There are over 500 of them in use in California and Nevada, where those interested can see their practical workings.

**ISRAEL W. KNOX, or
W. A. PALMER, inventors,**

At the Golden State Iron Works, No. 19 First Street, San Francisco.

ANNUAL REPORT

Pacific Insurance Company.

IN COMPLIANCE WITH THE ACT OF THE LEGISLATURE of the State of California, entitled "An Act concerning Corporations," passed April 22, 1864, the Pacific Insurance Company of San Francisco makes the following Annual Report:

I.—The amount of the Capital Stock of this Company is SEVEN HUNDRED AND FIFTY THOUSAND DOLLARS, and paid in GOLD \$750,000
II.—The amount of the Assets is ONE MILLION AND FIFTY ONE THOUSAND, FOUR HUNDRED AND TWENTY DOLLARS AND THIRTY SEVEN CENTS. \$1,051,420.37
III.—The Company has NO DEBTS
IV.—The amount of insurance effected during the year, and which remained in force December 31, 1865:

Marine.....\$12,973,949
Fire.....\$4,408
This Company commenced underwriting Marine risks, August 1, 1865.

V.—This Company insures against the following risks, viz.: BUILDINGS, HOUSEHOLD FURNITURE, MERCHANDISE, RENTS, LEASEHOLDS, VESSELS IN PORT AND THEIR CARGOES, and other PERSONAL PROPERTY, AGAINST LOSS OR DAMAGE BY FIRE. Also, on CARGOES, TREASURE, COMMISSIONS, PROFITS, and WAR RISKS, and ON ALL MARINE AND LAND NAVIGATION RISKS, TO AND FROM ALL PORTS IN THE WORLD.

VI.—This Company will take on any FIRST-CLASS RISK not to exceed \$75,000 (the limit fixed by law), and on all large risks will reinsure to an extent consistent with PRUDENCE in other RESPONSIBLE COMPANIES.

J. HUNT, President.
A. J. RALSTON, Secretary.

Send-ONE FOR IT.—The large, illustrated sixty-four column weekly newspaper—the San Francisco MINING AND SCIENTIFIC PRESS—should be taken by every miner, prospector, and intelligent citizen throughout Colorado, as it gives a mint of most useful information to be gained no other way, on mining matters generally.—Rocky Mountain News.

Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

HOADLEY'S.

FOUR SIZES,

8, 10, 12, and 15-Horse Power,

HOADLEY'S.

3 to 40-Horse Power.

HITTINGER'S.

THREE SIZES,

5, 7, and 10-Horse Power!

HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price.

These engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.

Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises), in fact, the portable principle is the miner's friend, and enables him to draw engines on their own wheels, to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with an without carriages.

Also, Portable Saw and Grist Mills.
For sale by
TREADWELL & CO.,
Corner of Front Market and Streets.

CRYSTALLIZATION OF METALS.—It is said to be a fact pretty well ascertained, that all metals which have had their crystallization destroyed by being drawn, hammered or annealed, will, in course of time, even if kept at perfect rest, return to their original crystalline state. It is well known that percussion will produce re-crystallization; but it is not so well known that the original arrangement of the molecules will be resumed if rest and time be given the mass. A correspondent of the *American Artisan* says that in removing an old wall where some block tin pipe had been allowed to remain a number of years, he was somewhat surprised to find that on hending them they cracked like bars of tin, which they could not have done when first drawn out. It is also said that the iron-shod piles of the old London Bridge, which were made of wrought metal, have lost the fibrous effects of the forge. It is generally supposed that metallic alloys are not so liable to lose their crystalline structure if, indeed, they lose it at all.

SCIENCE IN AUSTRALIA.—Melbourne, the chief city of Australia, boasts of a first-class scientific observatory, having an excellent reflecting telescope and all the other apparatus of a well-furnished astronomical institution. When will the moneyed men of California take the first step towards patronizing anything in the shape of a scientific institution. The Legislature of Australia has the name of being exceedingly liberal in its patronage of science, appropriating freely to the aid of scientific bodies and institutions. It is time the Legislature of California should do something in addition to its stinted annual appropriations for the Geological Survey.

LOSS BY FIRES.—It is estimated that nearly fifty millions have been lost in this country by fires, on sea and land, during the past year. The five principal causes of these fires, stated in their order of destructiveness, are said to be: First, carelessness of smokers in dropping their ashes and cigar ends; second, unskillful use and handling of burning fluid; third, the had construction of chimneys and furnaces; fourth, the want of precautions, such as are common in Europe, for preventing fires from spreading from room to room and house to house; and, fifth, the useless and dangerous custom of celebrating holidays by fire crackers and fire-works in the midst of towns and cities.

LARGE MASS OF COPPER.—The largest mass of copper which was ever brought away from the Lake Superior mines, was lately landed at Cleveland, Ohio. It weighed 15,000 pounds. It is estimated that in this mass there is fully ninety per cent. of pure copper. Besides this chunk, the Ironsides brought down 306 tons of copper, some of the masses being nearly as large and pure as the above.

FROM EGYPT TO AMERICA IN LESS THAN NO TIME.—M. Lesseps, the engineer of the Isthmus of Suez Canal, has telegraphed his congratulations to Mr. Field on the success of his (Field's) great enterprise. The message was dated July 30, at 1½ P. M., and arrived at Heart's Content at 10½ A. M., thus gaining three hours on time.

TIN FOIL.—The so-called tin foil is lead, with an exceedingly thin covering of tin. The difference in the cost of the two metals pays for the extra labor of making it thus.

STOCK CERTIFICATES, STOCK TRANSFER JOURNALS, STOCK LEDGERS, ASSESSMENT RECEIPTS,

And all other Blanks, Blank Books, etc., required by Mining and other Corporations, kept on hand or printed to order on short notice, at moderate prices, at the office of the Mining and Scientific Press.

PATENT BUSINESS.

We have lately associated with us in the Patent and Mechanical Department of the Mining and Scientific Press, a gentleman of superior ability and attainments, who has arrived direct from the leading patent agency in New York City, and having a faithful and reliable associate in Washington City, we are now better than ever before prepared to secure the claims of our applicants, in a careful, prompt and efficient manner. DEWEY & CO., Patent Solicitors. San Francisco, June, 1886.

ONE HUNDRED DOLLARS REWARD!!!

The above Reward will be paid to any one who will produce evidence of a failure of any of HENDY'S IMPROVED SELF-DISCHARGING CONCENTRATORS, Patented February 27th, and April 17th, 1886—which said amount is deposited for 60 days with Palmer, Knox & Co., No. 19 First Street, San Francisco. June 23d, 1886.

J. HENDY, Patentee.

Figure 1.

Figure 2.

Hendy's Improved Patent Self-Discharging Sulphurets

PRATER CONCENTRATOR

Is Receiving Universal Favor.

Reference is made to the following Mills which have them now in use:

BENTON MILL, Bear Valley, Mariposa County. LOUISIANA MILL, near Conditville, Mariposa County. OPHIR MILL, near Newcastle, Placer County. C. H. SCHWABER'S MILL, Doty Flat, Placer County. CONY MILL, Jackson, Amador County. SPRING HILL MILL, Amador, Amador County. GOLDEN GATE MILL, Volcano, Amador County. RAWBLIDE MILL, Jamestown, Tuolumne County. TATUNPO G. & S. M. CO., Lower California, Mexico.

And in use in many other parts of this State; also in Idaho, Arizona, Colorado and Mexico. As a further evidence of its worth, orders have been received recently from the proprietors of the following mills, all of whom are using these Concentrators, or have works in the immediate neighborhood of mills using them, viz.: One Concentrator for the Ophir G. & S. M. Co., near Newcastle, Placer County, ordered by Welly & Foster, who are using two Concentrators; one Concentrator for the Benton Mill, Mariposa County, ordered by Messrs. Dodge & Bro., of this city, who are using seven of them in the same Mill; one Concentrator, ordered by Messrs. Bigelow & Bro., of this city, for the Cony Mill, Jackson, Amador County, where they have already three of them in operation. They may be seen in operation at the GOLDEN STATE FOUNDRY, No. 13 First Street, San Francisco.

DESCRIPTION:

FIGURE 2 is a sectional view. C, is the Hopper in which the tailings are thrown. The tailings then distribute on the Distributor, B. The tailings enter the pan, A, at its periphery, and the debris discharges near its center, and passes off in the spout, F. The sulphurets discharge at gate, E, amalgam and quicksilver at plug, I. J, is a horn-shaped cavity for collecting quicksilver and amalgam. S, is the sulphurets. M, M, the agitating hars, with copper plate, coated with mercury. The agitating hars operate on top of the pulp. They are acknowledged to be, by those using them, a valuable improvement. [An extra charge of \$15 is made when these hars are furnished.] The pan, A, shows a curve-linear bottom, which gives a more precipitous descent near its center, for the purpose of forcing the sulphurets towards the periphery. It will be noticed that the centrifugal force diminishes towards the center of the pan, for which reason the inclination is increased for the purpose above mentioned.

The pan, A, has an inclination at its periphery, towards the gate, E, for the purpose of forcing the sulphurets to the discharge gate. At the same time the center rim is level; the sulphurets, S, being forced by the oscillating motion of the machine, and are discharged through a small opening in the pan at gate, E.

JOSHUA HENDY, Esq., San Francisco:—MY DEAR SIR: It gives me pleasure to inform you that the four "Improved Self-Discharging Prater Concentrators," which I purchased from you, have now been in operation in the Rawblide Mining Company's Mill for more than two months, and have more than realized my expectations. I am free to say it is the best Machine for saving quicksilver, Amalgam, and Sulphurets that I have ever used or seen used for that purpose. I shall take pleasure in showing any one interested the Machine in operation, who will call at the mill. I shall need four more as soon as the balance of our mill is completed. Yours truly, R. P. JOHNSON, Superintendent Rawblide Mill Company.

A Circular giving further particulars will be mailed to any part of the United States free of expense. Address, JOSHUA HENDY, 402 Montgomery street, San Francisco, Room 3, Fourth Floor.

Pacific Mail Steamship Co's THROUGH LINE TO NEW YORK, Carrying the United States Mail.

LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.
On the 10th, 18th and 30th of each month that has 30 days.
On the 10th, 18th and 30th of each month that has 31 days.
When the 10th, 18th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following.
Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.
Departures of 18th or 19th connect with French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America.
Departure of 10th connects with English steamer for Southampton, and P. R. Co.'s steamer for Central America.
Departure of 30th connects with English steamer for Panama, the port of the new mines.
The following Steamships will be dispatched on dates given below:
September 10th—CONSTITUTION, Capt. E. S. Farnsworth
Connecting with ARIZONA, Capt. Maury.
September 18th—COLORADO, Capt. J. T. Watkins.
Connecting with HENRY CHAUNCEY, Capt. Oray.
September 29th—SACRAMENTO, Capt. J. M. Cavery.
Connecting with OCEAN QUEEN, Capt. Weir.

Chin passengers berthed through. Baggage checked through—100 pounds allowed each adult.
An experienced Surgeon on board. Medicine and attendance free.
The steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.
Through Tickets for Liverpool by the Inman Line, can be obtained at office P. M. S. & Co., San Francisco.
For Merchandise and Freight apply to Messrs. WELLS, FARGO & CO.
The splendid steamship COLORADO will be dispatched for CHINA on TUESDAY, January 1, 1887.
For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

COAL AND STEAM SUPERSEDED.

The following article, with the above imposing title, which appeared originally in the London *Mining Journal*, and which has been copied, with apparent approval, into many of both the Atlantic and California papers, is one of a class of articles, some of which are almost constantly before the public, and which are not only ridiculous in their assumptions, but oftentimes positively mischievous by means of the inducements which they hold out for people, frequently at great cost of time and money, to seek for impracticable and impossible results. The article came to us without any illustration; but in order that it may be more clearly understood, and its absurdity made perfectly apparent, we have handed it to a friend, who has kindly supplied us with a diagram, such as was described, and we have made such interpolations in the original, as were necessary to make the references to the same complete:

A great deal of interest is attached to some experiments which have taken place at Liverpool to demonstrate the merits of a machine invented by Mr. James Smith, of Seaford, and Mr. S. A. Chase, of Egremont. The invention offers a complete solution to the problem—*How can we obtain Perpetual Motion?*—and if it be generally employed for the production of motive power, the calculation of the Royal Commission for ascertaining the position of our coal supply will be so seriously interfered with as to be almost valueless, for it may be found that before many years have passed away men will no more think of using steam to obtain motive power than they now do of rubbing sticks together to get fire.

The invention is for an "improved arrangement of valves and other appliances for raising water and other fluids above their common level, the fluids so raised to be used as a motive power." The principle of the invention consists in constructing a reservoir having two compartments, A and B. The upper compartment has a lift pump, C, for raising water from the lower compartment, producing two different levels of the fluid in the one reservoir. Into the lower level of the fluid they insert a portion of a tank or tanks, D, allowing the fluid in the reservoir to have free play around them.

Inside, and on the bottom of the tank or tanks, is fixed a box, having two sets of valves, E and G, composed of gun-metal, one set opening to the fluid contained in the reservoir. These valves are so arranged that when the pair or set of valves in communication with the fluid in the tanks are open the other pair or set are closed, and shut off the communication, and vice versa. On the upper side of the box is a circular aperture, around which is fitted a cup leather valve. This valve fits the lower part of an air-tight cylinder or float, F, and which is inserted in the circular aperture, and by means of connecting rods the cylinder or float is attached to the end of a lever or beam, I. The other end of the beam is united by two connecting-rods to the crank of the engine, K, and the piston-rod of the lift-pump. On the shaft is fixed an eccentric to work the gear which actuates the tank valves. On the head of the tank they fix a feed pipe or syphon, L, which passes downwards into the upper compartment of the reservoir, having a valve attached to it, which is always kept beneath the high level of the fluid in the upper compartment of the reservoir, and thus acts as a syphon. They then fill the tank and feed-pipe with water, and raise the fluid in the lower compartment of the reservoir until the tank-valves are submerged. They then fill the upper compartment, which contains the lift-pump, to within a few inches of the lid of the tank, when the engine is ready for use. The production and cause of motion may be thus described:

The floats being hollow, and merely filled with atmospheric air, are lighter than a space of equal magnitude filled by a column of water, and it, therefore, follows of necessity that when the tank-valves are open to the gravitic force of the fluid contained in the tank, that force acts on the bottom of the float and causes it to rise, and when the valve is closed against the action of the gravitic force in the tank, and open to the reservoir, the float falls, there being no power beneath to support it, thus producing a reciprocating motion, which, acting on the beam, produces rotation of the crank, and at the same time actuates the eccentric, causing the tank-valves to open and close; and this motion is continued until the syphon-valve is closed, shutting off the atmospheric pressure by which the water or other fluid is forced into the tank by the syphon feed-pipe, and by which the water or other fluid is raised through the agency of the lift-pump into the upper compartment of the reservoir.

The apparatus described above is one of the many inventions for the purpose of obtaining perpetual motion, and, like the most of such, it displays considerable power of contrivance on the part of its inventors; and, like them all, it will be attended with non-success, and prove itself but a source of expense and disappointment to those interested, however fondly they may cherish it. As it forms a good illustration of the many contrivances for that purpose, we have chosen to lay it before our readers; and in order that they may be able to comprehend its operation, and to enable us to show its uselessness as a source of power, we have requested our engraver to prepare the annexed diagram to illustrate its operation.

When the valve from the tank to the box opens and the float ascends, a body of water equal to the displacement of the float enters; and when the valve from the box to the lower compartment of the reservoir opens and the float descends, the same quantity of water flows into that compartment. This quantity of water requires to be raised from the lower to the upper compartment during each revolution, as above described.

The power obtained is derived from the dif-

ference in the weight of the float raised the height of the stroke and that of the water descending to take its place, also the pressure of the column of water on the plunger, and the weight of the plunger in descending. The power expended is in pumping the same quantity of water used in the above operation from the lower to the higher level in the reservoir, the distance which it requires to be raised being equal to that of its descent.

UP STROKE.	Power spent.	Power obtained.
Assume the weight of the float to be 10 lbs., raised 1 foot.....	10 lbs.	
Weight of water descending 1 foot.....		70 lbs.
DOWN STROKE.		
Pressure on the float descending, 1 foot.....		70 lbs.
Weight of float descending, 1 foot.....		10 lbs.
The float in descending necessitates the displacement of a quantity of water from the tank of the reservoir equal to what entered during its up stroke.		
Weight of water to be raised by the pump.....	140 lbs.	

Which shows that the quantity of water raised during each revolution, must necessarily be the same as that used in the operation of the float, to cause its upward and allow its downward movement, and requires that the pump with the same stroke to be twice the area of the float.

The result here shown produces an exact balance of power, allowing nothing to overcome friction, much less to yield power for other purposes.

Inventors of apparatus having the same object in view as that we have examined, would do well to use the powers by which they are endowed on other and more profitable pursuits. If they would, instead, study thoroughly the laws by which matter operates, they would in the end find themselves wiser, possessed with more accurate knowledge, freer from disappointment, heavier in pocket, and more useful to themselves and those around them.

TRADE MARKS SHOULD BE RESPECTED.—Suit has been commenced in the Twelfth District Court by A. B. Falkenburgh and R. P. Thomas, against George R. Lucy and Charles Hymes, and for cause of action aver that they have been doing business under the firm name of the "Standard Soap Company," and one of the plaintiffs having invented a preparation or compound for washing purposes, and gave thereto the name "Concentrated Erasive Washing Powder," the said compound was offered for sale in packages of various sizes, marked with a label adopted by the plaintiffs as a trade mark. By reason of the excellency of the article and the efforts of the plaintiffs to place it before the public, it has acquired a high reputation as such, and has commanded and still commands an extensive sale. The defendants, totally disregarding the rights of the plaintiffs, have put up an article in imitation of the plaintiffs' article, which, with intent to defraud and deceive the public, they have caused to be put up in similar packages and labelled with a similar label. By reason of this fraud upon the public, and disregard of the rights of the plaintiffs, they have suffered great damage, and pray the court to grant them damages in the sum of \$5,000, and an injunction restraining the defendants from preparing, putting up or offering for sale said imitation.

AN EDITOR HONORED.—At the recent Commencement of Waterville College, Maine, the honorary degree of Master of Arts was conferred upon Warren Baxter Ewer, editor of the *Mining and Scientific Press* of this city—*S. F. Bulletin*.

In the absence of Mr. Ewer, we venture to say that the conferment was as worthily bestowed as it was unexpectedly received.

THE GREAT SAW OF THE TIMES.—Doctor McGowan's communication last week, calling upon our mechanics to produce a saw suitable for abbreviating a section of the Mammoth Tree, for exhibition at the Universal Exposition, has caused considerable discussion in the daily papers. Mr. James M. Hall, carpenter, advances the plan of fastening two circular snws at the end of an axle a foot long, and this axle to be fitted in a movable frame and driven by steam. It would cost a greater sum to get such an apparatus upon the ground than Mr. N. W. Spaulding (a practical and experienced mechanic and saw manufacturer), would ask to undertake the contract for severing the "log." Mr. Spaulding would employ a common cross-cut saw, with the slight variation of having the handles inclined to one side, to give room between the handles and the face of the cut for the operators' hands. He would make two cuts, say four feet apart, splitting out the intervening section, as required in proceeding. This would leave a true face on the block, which would be ready to split into blocks, in the shape required for mapping out the several States of the Union. The "stick," we believe, is between thirty and thirty-five feet in diameter, as it now lies. Its texture is about as soft as redwood, or the clear portion of Eastern hemlock. Two men could probably get through the job in the above manner in two or three weeks, at a cost of from \$100 to \$150.

Dr. Pinge-Dupuyten exhibited to us, on Monday, a chain saw, used by physicians in the amputation of limbs, which suggests a good theoretical plan for the construction of an implement for accomplishing the desired work. It would prove costly for a single purpose, and take a good deal of power to operate it, with danger of breakage. Thirty feet is a long cut, besides the chain would need to be nearly twice that length, in order to discharge the sawdust on each side, even if it could be thus excluded without difficulty.

Another mechanic offers to cut off as many sections of the tree as is desired, at a trifling cost, by the process of boring with a "shell auger." It was partially by this manner that the tree was cut down, and no doubt the laborers who performed the operation, considered it a practical bore—long before they finished.

WHAT GOLD COMPANY in the United States works quartz that holds less than \$6 or \$8 to the ton? and even then the rock must be decomposed or it will not pay.—[*American Journal of Mining*, N. Y.]

Many of the most profitable quartz mines of California, producing entirely hard rock, average less than \$6 or \$8 per ton. We have in view several of that character, one of which has been worked over twelve years, and is now worth upwards of \$100,000.

J. ARTHUR PHILIPS, the distinguished English geologist and metallurgist, who visited this State last winter, is now again on his way hither. Dispatches received the past week from New York announce his arrival in that city, and state that he will sail for California on the steamer of the 21st instant. It is presumed that Mr. Philips' second mission to this coast is in behalf of English capitalists.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

Notes on the Chief Gold Districts Throughout the World.

BY PROFESSOR ROWLANDSON, F. G. S. L.

[Continued from Page 130.]

AUSTRALIA, NEW ZEALAND, ETC.

A short time prior to the discovery of gold in Australia, I had been led to infer, from the examination of ores derived from Central America, and Chili in particular, as well as from Mexico and various parts of South America, and comparing the accounts given of the rocks from which such ores had been derived, that a strong probability existed that it would be eventually discovered that the auriferous and argentiferous veins of these districts belong to geological zones more recent than the paleozoic. Shortly after the discovery of gold in the vicinity of Bathurst was made known in England, the writer was consulted as to the probability of gold being found on certain properties in various parts of this territory. The only sources of information then available were travels and topographical works by Sir Thomas Mitchell and others, Count Strzelecki's New South Wales and Van Diemen's Land, a work by Lozke, a Pole, and another by a German, whose name has escaped my memory. The only work amongst those named which treated in any marked manner on the age of the Australian rocks, was that of Count Strzelecki, published in 1845, some five years prior to the discovery of gold in the country described. In the treatise under notice, Count S. divided the rocks into four epochs—the first described as consisting of granites, porphyries, feldspar and serpentines, as consisting of erupted or crystalline and unstratified rocks; to the same era he has placed mica schist, silicious, and common argillaceous slate. Notwithstanding the admission in this description of erupted rocks: the general classification smacks largely of the Wernerian school, including several of its most manifest errors. Count S., in the work alluded to, makes a quotation from Humboldt's *Asie Centrale*, in consequence of the striking resemblance between the granitic masses of Australia and those found in the Altai, of which the following is a translation:

"Nowhere in either hemisphere have I seen granites which present more the character of erupted or effused rocks than the granites which surround the Altai group. These isolated rocks, like porphyries or basalts, are unaccompanied by gneiss or mica schist. These rise from the steppe at the base of the Alpine mountains in forms the most fantastic. When upon the steppe of Platovsk, we first perceive in the horizon the saw of the Tigirezk Alps, which rises itself near the rocky borders of Lake Kolyvan. Through the whole of this region the traveler is compelled to notice numerous eruptions of granite, which, in many places, are of quadrangular forms, and springing from perfectly level ground. These rocks are sometimes in lines, and sometime scattered over the plain, assuming the most fantastic resemblances of narrow (*etroit*) walls, turrets, or polygons. The smallest hills resemble rostra, beeches, or funeral monuments. What especially gives a strange appearance to this region is the contrast of height and volume of the gneiss masses. Some possess an elevation of five hundred feet—for example, the *Vysokaya Gora*; others scarcely attain a height of seven or eight feet, which reminds the observer of the diminutive volcanic upheavals which in Spanish America are designated 'Mal-pays.' On arriving at the village of Sanchkina or Saachka, the traveler finds himself at the center of these eruptions. * * * * *

"Other very extraordinary forms again present themselves in the granitic rocks which rise along the southern slope of the Altai, between Boukhtar-Miask, Naryn, and the Chinese station of Baty. These are either ball-shaped and flattened hemispheres, or cones lying in the middle of the plain of Haut-Irtische, cones often terminating with lateral spurs in the form of very low and extremely elongated walls, causing the surveyor to at once pronounce them as originating from the effect of matter in a fluid state, being ejected from a crevice."

To such readers of the SCIENTIFIC PRESS as may have followed the writer from the commencement of this series, the above quotation will form an instructive illustration of the

character of the Altai gold field, which was alluded to in a previous paper; those who feel disposed to follow the writer to the conclusion, are requested to bear the same in remembrance, as it will certainly once again be alluded to, and probably oftener.

I am not aware that the more detailed observations of the public geological survey has materially changed the general outline of the so-called first epoch of Count S., which, as delineated by him, commences at Wilson's Promontory, 39° south latitude, and continues almost uninterruptedly to Illawarra, in 35½°, the widest portion, or about three hundred miles, being a little north of the celebrated Balarat gold field. The widest part of the region is found between 37° and 35° south latitude, where, with some extensive spurs, it is, perhaps, not less on an average than 120 miles wide, and how far into the interior similar rocks may be found is unknown. In this district lies the Australian Alps, at the southwestern slope of which is found the celebrated Victoria gold region. Granite is described as constituting almost the entire floor of New South Wales, to the entire exclusion of mica slate and gneiss, and as extending far into the interior of New Holland, in masses of mamillary, tuberos, globular or botryoidal form.

The New South Wales or Sydney gold district is formed of similar alternating rocks of granite, basalt, etc., but these are less massive than those connected with the Australian Alps, which, so far as at present ascertained, occupy a detached portion of a much greater breadth, namely, from about sixty miles to the west of Sydney until the great central plain is reached, the floor of which latter is probably composed in a large proportion of granite or granitoid masses, the entire width as known cannot be less than two hundred miles.

The second epoch of Count S. is stated to consist of unstratified quartzose, felspathic and clay stone porphyries, granular quartz rock, columnar, schistose and amorphous greenstone, serpentinite, basalt, trachite silicious breccia, compact, massive, and foliated granular limestone. The description just given is indicative of highly altered rocks, in consequence of the proximity of the igneous ones just described. They are not extensive, whether considered as respects either depth or area, and are generally found in detached portions, separated at wide intervals, each area possessing its own strike and dip, generally presenting, however, evidences by which the former continuity may be traced. The organic remains found in this series consists of varieties of *fenestella*, *productus*, *terebratula*, and a *conularia* (*levigata*) *spirifer*, *pleurotomaria*, *pachydomus*, *belerophon*; and north of Canoblas crinoidal columns have been found, accompanied by *orthoceras* and impressions of trilobites, not exceeding half an inch.

The Syphon Discussion.

Messrs. Editors:—Your article on "The Use of the Syphon in Mines" has attracted my attention. I have had a fifteen years' experience with an inch and a half lead pipe syphon, in drawing water from a well on a hill-side, and discharging it at a lower level a half mile distant.

The first month's experience was that of almost daily success and disappointment. The accompanying diagram, used in illustrating your article, will answer my purpose. I had the same difficulties with the long end of my syphon that your correspondent had; met with the same difficulty in filling the syphon from the funnel at top, though only with the long end. This led me to think that it must be owing to the deflections in the pipe. Accordingly, after having filled the pipe with all the water it would take, I tapped it at each of the most elevated points or arches of the deflections with a small awl; air rushed out, and when all had escaped and water made its appearance, I closed the orifices. In this way the syphon was, and always can be, perfectly filled with water.

Now, if every part of the syphon is tight, it ought to work well, provided the distance between the surface of the water in the well and the highest point at B, is not more than twenty-eight or thirty feet. Very few syphons will draw water effectually from a depth greater than twenty-five or twenty-seven feet, particularly if it has an altitude of a thousand feet or more above the level of the sea—the same law governing the action of the syphon as does

that of the common suction pump; both depend upon the pressure of the atmosphere to force up the water, either in the pump-stock or the short end of the syphon.

I found that from very pure soft well water more or less air would re-accumulate in the upper part of the deflections, requiring to be removed as before; and as the largest accumulation was always at B, instead of the cock and funnel alone, I substituted a copper globe of eight inches diameter, and placed the cock and funnel at top. Then when the pipe and globe were filled with water, and the cock on the globe closed, opening the cocks at the ends, A and C, would cause an uninterrupted flow for weeks, or until another accumulation of air had taken possession of the upper portion of the deflections, and nearly or quite filled the globe; then I would close the cocks at A and C, again, draw off the air from the deflections, and fill up the globe as before.

I had so much difficulty with the two principal deflections, that at last I affixed a globe to each; then it would work perfectly for three or four months without stopping, except when the water in the well would fall more than twenty-eight feet below the globe at B; then it had to stop, for it was as high as the pressure of the atmosphere at that locality could force it. Sacramento, Sept. 3d, 1866. W. W.

More About the Syphon.

EDITORS MINING PRESS: The Arthur mine, near Gilroy, has a syphon made of one inch gas pipe, 700 feet in length, with an elevation of fifteen feet to overcome. It has a small hand pump attached to it near the outlet, to exhaust the tube of air and start the flow of water. It is a perfect success, and far superior to lead pipe. It is in joints, and any joint can be taken out to remove any obstruction, by sediment or otherwise, and again replaced in a few minutes. It requires no protection, as it will bear a heavy stroke or pressure without yielding. It is much cheaper than lead pipe. It can be bent into any desired angle or shape without kinking and without heat; and when no longer needed, it can be taken out conveniently and applied to other places or uses. In putting down it requires the same means to make it air-tight, as when used for conveying gas. Any one acquainted fully with laying gas pipe can give the needed information.

Muddy water running through a syphon will make deposits of sediment. In the lead pipe this cannot be removed; in the gas pipe the joints suspected can be taken out and heated in a smith's forge, cleaned and replaced. To avoid running muddy water, start the syphon by means of the pump (and this is much better and more convenient than the mode adopted by your "Yon Bet" correspondent), after the water has settled in your reservoir; then graduate your stop-cock so that it will cease flowing about the time the work begins the next day. I think the outlet ought not to be too much below the level of the reservoir, as this creates a much heavier draught upon the walls of the syphon, and is more likely to cause leaks of atmospheric air through any deficiencies, and perhaps even through the iron. In regard to the accumulation of air in the highest point of the syphon, I think, for the reasons stated by you, it is liable to occur under the best possible arrangement; but by the use of the pump the flow can be started again in a few moments.

Respectfully, D. HUBER.
Gilroy, Santa Clara Co., Sept. 5th.

Mining in Amador and Calaveras—Sulphurets.

EDITORS PRESS:—I have just returned from a hasty tour of inspection through several of the mining districts in the counties of Amador and Calaveras. Taking the stage at Latrobe, after a ride of some two hours I found myself on the borders of the ancient '49 placers—dug out and abandoned many times over, and now resounding with the thud of the quartz stamps—throbs of a new life—pulses of golden hopes. A short stop at Drytown enabled me to gather some valuable statistics, and many valuable specimens of ores from the neighboring mines. But Drytown has been too often spoken of by correspondents to allow any limited observations to be interesting. The same will apply to the town of Sutter. This stirring and much alive village boasts a foundry and machine shop, and has a very thriving and growing look. The great Haywood mine, worked to the depth of more than 1,300 feet (200 feet below the level of Montgomery street);

is the main life-artery of the place. Everybody knows about its Monte Christo yields of bullion. It is not the only mine here, by any means, but the principal one. It is situated on the great lode traceable from Mariposa through Tuolumne, Calaveras, and Amador counties—probably the most remarkable mineral vein development in the world. It is often called the "Mother Lead"—a very appropriate name. It consists of several members, or parallel leads, generally three in number. These are often separated to a distance of several hundred feet, and again coming so near to each other as to seem to be one single lode. The same or similar condition seems to prevail in most long and extensive lodes in all parts of the world. On this same vein is situated the Oneida mine, two miles south of Sutter. It has been long worked, and recently passed into the hands of its present owners. A vigorous and systematic style of work has been initiated. A 40-stamp mill is going day and night. Several new shafts, with new pumps and appropriate hoisting machinery, enable the mill to get its full supply of ore. Two miles further south is the town of Jackson, situated nearly over the great lode. The Coney mine and mill, just in the edge of town, have amply sustained the character of the Mother Lead at this point. The ore has heretofore yielded some seven or eight dollars per ton of free gold. The sulphurets, consisting mostly of yellow iron pyrites, concentrated from the tailings, of which they formed about ten per cent. by weight, were sold on the spot for \$180 per ton. The mill has sixteen stamps, and both mill and mine have been leased for twelve months to Messrs. Meader & Ambler, under the supervision of the latter gentleman. He has put up new concentrating machinery—an improvement of his own on the new shaking table. It seems to do its work well, and is not liable to get out of order. A good concentrator, by the way, is very much needed. Hungerford's late improvement seems to do its work very satisfactorily, but, unfortunately, those erected at the Oneida mill lacked strength in some part of its structure, and their use was temporarily discontinued, much to the regret of the mill owners. It seems the remedy of this one defect is easily arrived at. I suppose Hungerford will guard against the trouble hereafter.

The saving of sulphurets and their subsequent successful treatment for gold is creating a new era in California gold mining. Most of our mines hold a very large percentage of pyrites of iron, say from two and a half to twenty-five per cent. These hold usually valuable amounts of gold, but refuse to yield it up to the ordinary modes of amalgamation. I have seen mines on the Mother Lead abandoned because of the scanty yield, say \$5 per ton in free gold, holding at the same time twenty per cent. of sulphurets assaying at the rate of from \$300 to \$500 per ton. All this has, until very recently, been thrown away. Even now but few mills have fixtures for separating the sulphurets, but the valuable matter is being pretty generally hoarded; the tailings are no longer washed away but held for future use. Sulphuret men are now desirous of purchasing, and the millmen can usually get a fair price for the article on the ground. Many are not disposed to sell, but contemplate working their own sulphurets by and by, when the mode of treatment is better understood.

Mr. Ambler, formerly of Austin, I believe, backed by Meader of Stockton, the wealthy copper operator, is the main sulphuret man of Jackson. Beside the lease of the Coney mill, they own a mill and rich sulphuret mine near Volcano, and have also purchased a mill on Sutter Creek, just above the Haywood mine, which they are fitting up for sulphuret working. They have contracted, it is understood, for all Haywood's sulphurets. Their success will give new confidence to mine owners holding sulphuret mines with but limited amounts of free gold.

Auriferous sulphurets of great value are not confined alone to veins. I have myself taken samples of pyrites from the ordinary slates, far from any veins, and found gold in paying quantities. This I have verified in Placer county, near Auburn, and in Tuolumne county, near Sonora.

The heaviest percentage of auriferous sulphurets seems to exist in veins in granite, where the vein matter is frequently almost entirely pyrites. The veins contained in slate have usually less pyrites, but I think the pyrites are usually richer per ton. I have lately examined several groups of veins in granite, presenting peculiar and interesting features. I shall take the liberty of speaking hereafter of the Pine Grove, Volcano, West Point and Railroad Flat districts, all in the granite or limestone. Truly yours,
September 1st, 1866. SULPHURET.

Mechanical.

GLASS FOR DEAD-LIGHTS, ETC.

Glass, though regarded by people generally as one of the most ordinary materials with which we have to deal, is nevertheless one of the most extraordinary substances ever produced by the hand of man. Notwithstanding the many attempts to fix the period of its discovery, it is doubtful whether we have any correct idea of the time of its original introduction; and it is even more doubtful whether we actually know as much of its properties now, as was known in the days of Aristotle, 300 years before the Christian era.

Certain it is that the ancient Egyptians cast glass in large masses, and used it as columns, pedestals and other parts of their temples; and it is equally certain that they must have possessed certain information with regard to its manufacture of which we are now ignorant. The composition and process used by them is unknown to us. No glass manufacturer of the present day could toughen glass so as to make it at all answerable for the purposes to which it was employed 2,000 years ago. That it may be toughened to a certain extent, by a process of annealing, as practiced by plate-glass manufacturers and others, we know full well; but it is more than probable that the ancients employed some mixing process in the pots, by which they arrived at results which moderns have vainly sought to attain by annealing.

This toughening process is one of the most important desiderata connected with its manufacture. The practice of employing it for floors and sidewalk or dead-lights, and for water-pipes, etc., has recently attracted considerable attention to this particular. A recent article in the *Building News* gives the tensile strength of glass in bars at one ton to the square inch, and its compressive strength at twelve and a half tons. Thin plates are stronger in proportion than thicker ones; the same is also true of iron. To bear a transverse strain, it is about one-eighteenth as strong as iron.

Glass, like cast iron, is found to be exceedingly variable in its strength—some specimens standing a much greater strain than others of the same size. It is thought experimental researches will yet result in great improvements in this useful material. At all events, our knowledge with regard to its manufacture is far from being satisfactory, and a universal impression prevails among all skillful and intelligent manufacturers, that there is abundant room and good reason to hope for future improvement.

With regard to the glass sidewalk or dead-lights, now so common in this city, and which any one who traverses our streets must see, from the numerous fractures and openings they present, are constructed of an exceedingly poor material, it must be admitted that they are most execrable nuisances, inflicted upon our citizens by men who appear to possess neither science, taste or decency; still, perhaps we must excuse them, to some extent, from the necessities of the times, which require us to build both high and low, and to make the fullest use of every foot of ground not absolutely required for the carriage-way. If the practice is to be continued, it is hoped that our glass manufacturers will endeavor to furnish a better and tougher material than that hitherto employed. The surfaces of the plates, moreover, should be ground to prevent the slipping, which is so dangerous upon the smooth plates now almost universally used. Would it not be a good card for our San Francisco glass makers, if they could announce some valuable improvement in this direction? Shall we not hear from them?

GLASS BRICK MOLD.—A new mold for bricks is in use in Baltimore which is said to turn out most elegant specimens of pressed brick. The mold of wood is lined with plate glass, which forms a perfectly smooth surface and naturally gives excellent results. The cost of the mold is but little, if any, more than the ordinary wooden mold, and it can be easily applied to brick machines already in use. The brick comes out smooth with perfect sides and edges, the mold being raised from the palette or plate on which the bricks are made. It has, we understand given perfect satisfaction wherever used.

HEAT GENERATED BY MECHANICAL POWER OR FRICTION.—Some of the French scientific journals have been seriously discussing the feasibility of employing mechanical power to generate heat for certain practical purposes; thus reversing the usual order of things, of employing heat to produce power. An apparatus for this purpose has been arranged by M. Pelou, who calls his device a "Thermo-generator." It consists of a wooden core covered with hemp, revolving inside of a copper core; the two are enclosed in an outer vessel, through which a current of air is made to pass into a car or room which it is designed to warm. The air, in its passage, is heated by the friction produced by the wooden core revolving against the copper one. The inventor thinks that this will be found the most economical way of warming factories, work-shops, railway cars, etc. In the case of railway cars, the power requisite can be taken off from the axles. It is estimated that a train of forty cars can be warmed in this manner at an expense from the engine, not to exceed 2-horse power. *Cosmos* says that the plan has been submitted to a practical test, which has proven all that the inventor claims for it. The project is certainly correct in theory; for it is an established proposition that whenever heat is produced in overcoming friction, that heat is the exact reverse of the force expended. It is said that one of these heat generators is in actual use in Prussia; turned by a force equal to one-twentieth of a horse power, in ten minutes the air escaping from the apparatus had a temperature of 70°.

CONCRETE FOR BUILDING.—An ingenious application of the process of molding blocks of concrete for building purposes was patented recently in England. The inventor proposes to erect houses by literally casting them of concrete in the place they are intended to occupy. An ordinary concrete foundation is first laid, and upon the foundation horizontal frames, constructed of boards lined with zinc or other metal, are set up on edge, so as to form a kind of trough for receiving the concrete. By the insertion of suitable cores, holes for the insertion of the joists, or for other purposes, may be molded in the concrete as the work proceeds. The proprietor of the patent is now in Paris, superintending the erection of some houses on this principle, and we believe it is the intention of the French Emperor to build some laborers' cottages of this kind at one of the imperial farms. The invention will be illustrated at the Paris Exhibition.

The above is no doubt a very useful and practical idea for building, but there is nothing new in the idea. We saw concrete houses put up in that manner, in the neighborhood of Beaufort, South Carolina, more than thirty years ago; and we presume the same plan may have been adopted in other portions of the country.

WORKING FORCE FROM WATER PRESSURE.—There has recently been exhibited in England a "hydraulic coal cutting machine" which, with a supply of fifty gallons of water per minute, at a pressure of 300 pounds, will do as much work as twenty men. Such a machine is at work in a mine near Leeds; and when once supplied with water, it keeps going, using the quantity over and over again as long as may be desired, making twenty-five strokes a minute. It runs on the rails laid in the mines, and by the mere pressure of water will cut a length of nearly four feet an hour, and is so simple that an ordinary miner can work it.

The above is all very well and quite probable, with the exception of "using the quantity over and over again," which is simply an absurdity, unless some other power is present to elevate the water as fast as used.

THE PNEUMATIC DISPATCH, by which small parcels are transported from one part of a city to another, by means of the exhaustion of air from a tube, is familiar to our readers. It would appear from the following that there is some reason to think that this device may eventually become of much practical value: According to a report recently made by the directors of the Pneumatic Dispatch Company, it appears that 120 tons of goods can be transported through the tube every hour, at a speed of eighteen miles an hour, and that the cost is less than a penny (two cents) per mile. They anticipate large dividends from the line when completed to points outside of the city.

Scientific Miscellany.

A SCIENTIFIC METHOD OF CURING HAY.—It has been affirmed by eminent agriculturists that hay could be safely deposited in the mow in a semi-green state, and come out green, fragrant, and exceedingly palatable to stock, by sprinkling upon each load from four to six quarts of air-slacked lime. The philosophy of it lies in the chemical fact that lime is a powerful absorbent. The Rev. E. Willis, of Rockford, Ill., has tested this process. The weather last season was most inopportune for making hay. Finding it would be impossible to save the hay by out door exposure, he carted it into his barn in a heavy, green condition. He sifted the lime upon it, and it cured handsomely, and came out this spring as inviting as flowers pressed in an herbarium. His horses and stock devoured it greedily, and preferred it to the best sun-cured hay.

If the above is reliable, and we have every reason for believing it so, this fact furnishes a valuable bit of scientific knowledge to the farmers, more valuable, perhaps than the method we described last week, for preserving hay green throughout the winter. Necessity often compels haymakers to choose between the alternative of leaving their hay out to be spoiled by a drenching rain, or hurrying it into the barn with an almost certainty of its being spoiled there by heating and molding. Lime will absorb all the vegetable moisture and save the hay; while salt gathers moisture and fails in most cases to preserve it.

FALSE BUTTER.—We believe it is not generally known to housewives that there is a large quantity of very valuable solid material fed to the pigs with the buttermilk obtained in the dairy. A dairy-man, who always has an eye to science and economy, gives the following directions for saving this substance:

Place a common wire sieve over a milk pail, and pour the buttermilk into it; with a spoon move the straining gently from one side of the sieve to the other, until the buttermilk is drained off. What is left in the sieve is called false butter, and makes excellent shortening. If there is a large dairy, and butter made during the season, the strainings can be tried out, by placing them in an iron kettle over the stove, and simmering slowly until the sediment settles to the bottom. Turn off the top. The oil thus obtained answers the same purpose as real butter, in every department of cookery; besides it will do to fry cakes in, or oil cheese, etc. If a dairy-woman has never been in the habit of straining the buttermilk, she will soon learn, by so doing, that it is quite a saving.

THE AMERICAN MANUFACTORY OF MAGNESIUM.—So important has become the demand for the metal magnesium that a company has been organized for its manufacture. The *Boeton Bulletin* says: "The American Magnesium company have just commenced the manufacture of magnesium from dolomite, or magnesium limestone, by the Sonstadt method, and are producing the metal, both crude and refined, in considerable quantities. We do not doubt but that, as in other matters, perseverance will conquer all obstacles, and insure its success."

TO PREVENT GUNPOWDER MARKS.—Dr. Davies in a recent letter to the *London Lancet*, states that he has found the following treatment most successful: smear the scorched surface with glycerin, by means of a feather, then supply cotton wadding; lastly, cover with oil silk. In one case the discoloration was very great, the patient looking more like a mummy than a living being. It entirely subsided in a month by the above treatment.

INCOMBUSTIBLE FABRICS may be made as follows: A solution of acid phosphate of lime is treated with ammonia in excess, filtered and purified by animal black, concentrated by evaporation, five per cent. of gelatinous silica added, and the whole evaporated into a crystalline mass. The fabrics are immersed in a solution containing thirty per cent. of this mixture (called bottine), thirty-five per cent. of gum, and thirty-five per cent. of starch.

PAPER FOR PYROTECHNICAL PURPOSES is prepared from Chinese or Japanese silk paper, which has been treated like gun-cotton, and afterwards saturated with a solution of chlorate of barytes, or nitrate of strontian, chlorate of potash, etc. Paper so prepared is well adapted for the production of colored lights.

SMOKING OPIUM.—The true method of preparing opium for smoking is not known outside of the "Flowery Kingdom." No Chinese smoker will put up with an imitation, however much alike it may appear to an European. There is no drug which is more often or more easily adulterated than opium. The Turkey opium, which comes from Asia Minor, is adulterated with crushed raisins and "ealep." The former may be detected by ascertaining, with Barreswil's or any other cupro-potassic solution, whether grape sugar is present in the opium; the latter will be recognized by tincture of iodine, showing the reaction of starch.

ARTIFICIAL VS. ANIMAL HEAT.—Eminent engineers state that it has never been found possible to construct a steam engine that could utilize more than one-ninth of the energy of the fuel burnt under the boiler; one-fifth is quite as high as the practical average, but distinguished chemists assert that fully one-fifth of the heat derived from the combustion of food in the human body can be made available in the form of actual work.

THE COLOR OF GOLD.—Gold, as seen by the light reflected by its surface, is yellow. When gold is precipitated upon the walls of a glass jar by oxalic acid, its color is blue. When we hold a piece of gold leaf to a light, the color transmitted is green. This transmitted green color is supposed to be due to a mingling of the blue and yellow colors already described.

TO DETACH COPPER IN LITHARGE.—Put a small quantity into nitric acid; after a few moments dilute with water, and insert a piece of burnished steel—a polished knife-blade, for instance. If there is any copper present it will appear in the shape of a reddish deposit on the blade.

CAUSE OF RENNESSIN INFLAMMATION.—A series of careful experiments have recently been made upon animals with regard to the character of the blood coursing through inflamed parts. The amount of oxygen present has been estimated by treating the blood with carbonic oxyd, as recommended by Bernard, and the following conclusions have been arrived at:

1. That the venous blood returning from an inflamed part contains constantly more oxygen than the blood of the sound side, the proportion being as 1:1.5 or 2.5.
2. That the venous blood of the inflamed side contains more carbonic acid; and
3. That it is to the excess of oxygen in the venous blood, rendering it of brighter tint, that the increased redness of an inflamed part is due.

BOILING LIQUIDS IN VACUO.—All liquids in *vacuo*, as a general rule, boil at a temperature of 140° lower than in the open air, because of the diminished pressure of the atmosphere, which is usually about fifteen pounds on the square inch, when the barometer stands at thirty inches. At the elevation the "boiling point" of water is 212°, but at higher or lower measurements it is more or less. If you fill a tumbler with cold water, and place it beneath the exhausted receiver of an air-pump, the fluid will boil at 72° (212—140=72), or after a few minutes exposure to the rays of the sun at noon, any hot summer day.

HARDENING PLASTER OF PARIS.—Kumman, who has given much time to the study of the coloration of minerals, and their power of absorbing various organic substances, states that, if plaster of Paris, with enough water in it to give it the constitution $\text{CaO}, \text{SO}_2 + 2\text{H}_2\text{O}$, is steeped in a bath of hot-pitch, it loses its two equivalents of water, which are replaced by a corresponding quantity of pitch, and that it then becomes very hard and susceptible of a polish, so that it would be available for the construction of many articles for ornament or use.—*Journ. Franklin Institute.*

A SUBSTITUTE FOR BRITANNIA METAL.—An alloy composed of three pounds of lead, sixteen pounds of tin, and three pounds of zinc, is capable of being rolled out into plates for making white ware of superior quality, as a substitute for Britannia metal.

ABSOLUTELY PURE IRON.—The iron obtained by heating in the nitride of Hydrogen has a silver white color, is extraordinarily ductile, and may be easily cut with a knife. It dissolves in acids without leaving any residue, and is certainly the purest form of iron yet known.

ABOUT VINEGAR.—It was an observation made by Scheele, but the fact has recently been published as a new discovery, that ordinary brown vinegar will keep bright and clear for any length of time if heated to the boiling point for a few minutes.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, Sept. 15th, 1866.

The Money Market, since our last reference, has manifested a considerable change for the better, and more ease is apparent. The decreased amount of treasure sent forward to the East by the steamer of the 10th—only some \$700,000—to some extent accounts for the stringency of the market at that date. Money can now be had in Bank, on good first class paper, at 1½¢ per ct. per month. Savings Banks are obtaining from 1 to 1½¢ per mo., repayable in monthly installments, on the best mortgage security. The call for loans of this nature is quite large, with comparatively small cash balances on hand to meet the demand.

The Bank of California has declared a dividend of 1¢ per ct. per mo., for the month of August on their capital stock of \$5,000,000.

Gold Bars are quotable at \$40; with a free demand for the China market. Silver Bars are dull at 2¢ per cent. discount.

Coin Drafts on the East are given at 2½¢ per cent. premium; Currency do. at 40¢ per cent. premium on gold. Telegraphic Transfers are made at 4½¢ per cent., and 60 days' Sterling bills are sold at 49d.

Gold in New York on the 14th, by telegraphic advices, was sold at 146, and Sterling at 107.

During the past week some \$50,000 of Legat Tender Notes were sold within a range of 71½¢ to 72½¢, and were quoted yesterday at 71½¢. U. S. 7-10 Notes, August issue, were sold at 75½¢ cents, and June issue at 77¢ to 76¼¢ seller 30.

City Stocks are inactive. We note the sale of 100 shares Fireman's Fund Insurance Company at 119¢ per cent. The Front Street, Mission and Ocean R. R. Company have, up to this date, issued 5,000 shares of their stock, on which \$20 per share have been paid.

Since our publication of the condition of the Savings Banks of this city, on the 25th of August last, and in which no report was given of the California Building, Loan and Savings Bank, the Board of Directors of this institution—earlier than was anticipated—submitted their fifth annual report to the shareholders on the 10th inst., and from it we obtain the following:—Assets, \$500,000; an increase of \$249,774.75, in one year. This amount, we presume, for the most part, comprises deposits, and if added to the previously reported deposits of the Savings Banks of this city will swell the aggregate to \$9,260,164.52. The profits of this Bank are set down at \$27,423.56, for the six months ending April 30th, and deducting interest due and paid to depositors, dividend to stockholders, and expense of management during that period, amounting to \$22,122.25, leaves a net gain of \$5,301.41. This surplus sum placed to their previously accumulated reserve fund, together with the paid up capital, gives a total of \$56,000 as a fund against any loss, making the entire reserve of the Savings Banks for the first six months of the present year, as near as can be ascertained, \$308,918.94. The profits of this institution—\$27,423.56—increases the former statement of the gross earnings of all the Savings Banks to \$521,214.10. The amount of "cash on hand" is not reported. A dividend of 1¢ per cent. per month to depositors and 1½¢ per cent. per month to the stockholders has been declared by the Board as set forth in their report.

At a meeting of Odd Fellows held at their Hall, on the evening of the 12th inst., preliminary steps were taken towards the formation of a Savings Bank. A committee was appointed to report upon a proper form and manner of organization.

The Mining Share Market has been exceedingly inactive during the week just closed, exhibiting a limited range of transactions at the Board. A few leading ones show considerable improvement, while less favored shares, with few exceptions, maintained previous quotations. The more prominent companies are making very creditable exhibits, and since our last issue we note that the following companies have declared dividends:—Hale & Norcross, Savage, Yellow Jacket, and Imperial.

Savage has materially improved, opening at \$1,100, steadily advancing to \$1,157.50, and closing yesterday at \$1,150 bid. This Company declared a dividend of \$50 per foot on the 8th inst., which

amounts to \$40,000, leaving a surplus of \$30,000 to be carried forward, together with 2,400 tons of ore, free from all mining expenses, the average value of which is helieved to be about \$65,000. The south drift in the Curtis shaft is improving, and in the upper station the drift is now 180 feet from the shaft. During the week ending Sept. 8th, the greater part of which was spent in making repairs, 391 tons were sent to custom mills, and 557 tons of ore were amalgamated.

Hale and Norcross continues to be firmly held and is well maintained at previous quotations; \$1675 seller 30, was bid during the week, with no sales in the Board. Deducting the dividend of \$75 per foot, payable on the 15th inst., amounting in all to \$30,000, from the gross sum in the treasury, will leave a cash balance of \$80,000 on hand. The mine continues to look well, and no unfavorable indications are apparent.

Yellow Jacket has also met with some improvement, rising to \$780, then selling at \$775, advancing to \$815, receding to \$792.50, huyer 3, and closing yesterday at \$790. During the month of August the receipts of bullion produced from 127½ tons of 1st class, and 9,847 tons of 2d class ore, amounted to \$379,699.92, averaging about \$38 to the ton. The disbursements amounted to \$249,455.43, the following being the largest items of expenditure: crushing, \$148,851; assay, discount, and Federal tax, \$16,066; timbers, \$15,127; and supplies for mine, \$6,430. The Morgan Mill crushed 2,025½ tons of ore, yielding \$82,550; this gives an average of \$40.74 per ton. The amount of cash in bank is reported at \$389,126, from which deduct the dividend of \$50 per foot, payable on the 15th inst., (\$60,000,) and \$162,804 amount of indebtedness, and a balance of \$166,322 remains to the credit of the company.

Crown Point has been dull, and few sales were made during the week; receded from \$875 to \$860, then dropped to \$800, seller 10 and held at the close at \$825. During the week ending September, 8th, 661 tons of ore were extracted from the mine, or an average yield of about 100 tons per day. The "breast" of the south drift exhibits four feet of ore, and the general appearance of the mine is very favorable to an increased production for the present month.

Gould & Curry has been very dull and inactive, with a downward tendency, a few feet changing hands at \$700 to \$690, closing \$680 bid. There is nothing of importance to note at this time in regard to the mine. This company now have \$10,000 in the treasury, and there is some prospect of a dividend at an early day.

Ophir has been dealt in at an advance, opening at \$200, steadily improving to \$212.50, huyer 30 to \$207.50, seller 30, at which price 34 feet were sold, then sold at a still further advance, \$230, huyer 30, closing yesterday at \$220 h. 30.

Chollar-Potosi was quite active early in the week, advancing to \$142, receding to \$139, rallying to \$150, huyer 30, then selling at \$145 to \$142, and closing at \$145. In the Blue Wing station, running west, a body of ore and quartz, from 20 to 25 feet wide, was encountered, and an average assay of an assorted lot produced \$22 to the ton. During the week ending September 8th, 521 tons of ore were shipped to custom mills.

Imperial has met with few sales at \$98.50 to \$98 per share; closing at \$96. This company declared a dividend of \$6 per share, payable on the 15th inst. The Holmes' mine continues in good ore. About \$10,000 in bullion were realized from the first week's clean up of the present month at the Rock Point Mill.

Belcher was held at \$120 to \$125, huyer 30, early in the week, then receded to \$117.50 to \$116, and was quoted yesterday at \$120.

Empire Mill and Mining Company dropped to \$75, selling yesterday at \$77 per share. Alpha sold at \$50. Confidence advanced from \$59 to \$61, huyer 30, and closed yesterday at \$58 bid. Overman fluctuated from \$15½ to \$11, selling at the close at \$11. Bullion, \$26, huyer 30 to \$23. Some 1,000 shares of Sierra Nevada changed hands within a range of \$6.50, less assessment, to \$10.50, closing yesterday at \$9½ to \$8½.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday, amounted to \$278,900.

NATIONAL MINERAL LAND ACT.

Having received an authentic copy of this law, we reproduce it in our columns. Our former publication, however, was substantially correct:

Section 1. Be it enacted, That the mineral lands of the public domain, both surveyed and unsurveyed, are hereby declared to be free and open to exploration and occupation by all citizens of the United States, and those who have declared their intention to become citizens, subject to such regulations as may be prescribed by law, and subject also to the local customs or rules of miners in the several mining districts, so far as the same may be in conflict with the laws of the United States.

Sec. 2. And be it further enacted, That whenever any person or association of persons claim a vein or lode of quartz or other rock in place, bearing gold, silver, copper, or other mineral, having previously occupied and improved the same according to the local customs or rules of miners in the district where the same is situated, and having expended in actual labor and improvements thereon an amount of not less than \$1,000, and in regard to whose possession there is no controversy or opposing claim, it shall and may be lawful for said claimant or association of claimants to file in the local land office a diagram of the same, to be extended laterally or otherwise as to conform to the local laws, customs and rules of miners, and to enter such tract and receive a patent therefor, granting such mine, together with the right to follow such vein or lode, with its dips, angles and variations, to any depth, although it may enter the land adjoining, which land adjoining shall be subject to this condition.

Sec. 3. And be it further enacted, That upon the filing of the diagram as provided in the second section of this act, and posting the same in a conspicuous place on the claim, together with a notice of intention to apply for a patent, the Register of the Land Office shall publish a notice of the same in a newspaper published nearest to the location of said claim, and shall also post such notice in his office for the period of ninety days; and after the expiration of said period, if no adverse claim shall have been filed, it shall be the duty of the Surveyor General, upon application of the party to survey the premises and make a plat thereof, and upon the filing of the same, together with the number and description of the location, the value of the labor and improvements, and the character of the vein exposed, and upon the payment to the proper officer of five dollars per acre, together with the cost of such survey, plat and notice, and giving satisfactory evidence that said diagram and notice have been posted on the claim during said period of ninety days, the Register of the Land Office shall transmit to the General Land Office said plat, survey and description, and a patent shall issue for the same thereupon; but said plat, survey or description shall in no case cover more than one vein or lode, and no patent shall issue for more than one vein or lode, which shall be expressed in the patent issued.

Sec. 4. And be it further enacted, That when such location and entry of a mine shall be upon unsurveyed lands, it shall and may be lawful, after the extension thereto of the public surveys, to adjust the surveys to the limits of the premises according to the location and possession and plat aforesaid, and the Surveyor General may, in extending the surveys vary the same from a rectangular form to suit the circumstances of the country and the local laws, customs and rules of miners. Provided, That no location hereafter made shall exceed two hundred feet in length along the vein for each locator, with an additional claim for discovery to the discoverer of the lode, with a right to follow such vein to any depth, with all its dips, variations and angles, together with a reasonable quantity of surface for the convenient working of the same as fixed by local rules; and provided further, That no person may make more than one location on the same lode, and not more than three thousand feet shall be taken in any one claim by any association of persons.

Sec. 5. And be it further enacted, That as a further condition of sale, in the absence of necessary legislation by Congress, the local Legislature of any State or Territory may provide rules for the working of mines, including easements, drainage and other necessary regulations for the completion, development, and these conditions shall be fully expressed in the patent.

Sec. 6. And be it further enacted, That whenever any adverse claimants to any mine located and claimed as aforesaid, shall appear before the approval of the survey, as provided in the third section of this act, all proceedings shall be stayed until a final settlement and adjudication in the Court of competent jurisdiction, of the right of pre-emption to such claim, when a patent may issue, as in other cases.

Sec. 7. And be it further enacted, That the President of the United States be, and he is hereby authorized to establish additional land districts, and to appoint the necessary officers and clerks for such districts, wherever he may deem it necessary for the public convenience, in executing the provisions of this act.

Sec. 8. And be it further enacted, That the right of way for the construction of highways over public lands, not reserved for public uses, is hereby granted.

Sec. 9. And be it further enacted, That whenever, by priority of possession, rights to the use of water for mining, agricultural, manufacturing or other purposes, have vested and accrued, and the same are recognized and acknowledged by the local customs, laws and the decisions of Courts, and the possessors and owners of such vested rights shall be maintained and protected in the same; and the right of way for the construction of ditches and canals for the purposes aforesaid is hereby acknowledged and confirmed: Provided, however, That whenever, after the passage of this act, any person or persons shall, in the construction of any ditch or canal, injure or damage the possession of any settler on the public domain, the party committing such injury or damage shall be liable to the party injured for such injury or damage.

Sec. 10. And be it further enacted, That whenever, prior to the passage of this act, upon the lands heretofore designated as mineral lands, which have been excluded from survey and sale, the Secretary of the Interior may, by citizens of the United States, or persons who have declared their intention to become citizens, which homesteads have been made, improved and used for agricultural purposes, and upon which there have been no valuable minerals of gold, silver, copper or other mineral discovered, and which are properly agricultural lands, the said settlers or owners of such homesteads shall be entitled to purchase the same at the price of \$1.25 per acre, and in quantity not to exceed one hundred and sixty acres; or said parties may avail themselves of the provisions of the act of Congress, approved May 20, 1862, entitled "An Act to secure homesteads to actual settlers on the public domain," and take amendatory thereof.

Sec. 11. And be it further enacted, That upon the survey and sale of lands aforesaid, the Secretary of the Interior may designate and set apart such portions of the said lands as are clearly agricultural lands, which lands shall thereafter be subject to pre-emption and sale as other public lands of the United States, and subject to all the laws and regulations applicable to the same.

Passed July, 1866.

Judicious Resolutions.

Several of our most substantial and judiciously managed mining corporations have passed resolutions, since the approval of the new assessment law, requiring all notice of assessments and sales to be published in the MINING AND SCIENTIFIC PRESS, the only thorough (daily or weekly) mining journal on this coast. Our efforts to concentrate all mining advertisements in one paper, for the economical convenience of shareholders and assessment payers, are meeting with decided success. Those who believe in supporting the mining cause, should bear our paper in mind, and bring up this subject at the next trustee or shareholders' meeting.

Our Patent Agency.
The PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS has been organized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of Letters Patent from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Postage.—The postage on the MINING AND SCIENTIFIC PRESS to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and country. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked with French and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

New Mining Laws of California and Nevada.

We have just issued, in cheap edition, the new laws relating to mining and corporations in California and Nevada, passed in 1865-6. Some of these laws are of the highest importance to parties interested in the matter of locating and holding claims, and prospecting mines, in these States. Copies sent by mail. Price, 25 cents.

Address, DEWEY & Co., Patent Agents.
San Francisco, May 1st, 1866.

Rheumatism !!

ANOTHER WITNESS!

SALMON FALLS, June 17, 1866.
H. BOWMAN—DEAR SIR:—HAVING HAD A FAIR test of the virtue of RICHARDS' REMEDY FOR RHEUMATISM, I take great pleasure in stating that its effects with me have been even better than its recommendations claim. In 1863 I first heard of the Medicine. I had then been for three years severely afflicted with Rheumatism, and having tried everything I could hear of, without any permanent benefit, I concluded to try this also. On taking the medicine, in three days I experienced great relief, and in one week was entirely free from pain, and had completely recovered the use of my limbs, which had become almost powerless, so much so that I could not dress myself without assistance. Since that time I have been free from Rheumatism. I have recommended RICHARDS' REMEDY to numerous friends, and in every case it has proved successful. I therefore take great pleasure in recommending it to all who are afflicted with Rheumatism, and especially to all mercurial chronic Rheumatism cases.

Yours respectfully,
H. BOWMAN,
President of the Gen. Grant Mining Company.

RICHARDS' REMEDY is for sale by
H. BOWMAN,
Druggist, Sacramento, 11v13

YOUNG MEN WANTED!

Pacific Business College!

751 Market street, between Third and Fourth,
SAN FRANCISCO.

AN INSTITUTION DESIGNED TO PREPARE YOUNG and middle-aged men for an active and successful business life.

BOOK-KEEPING, PENMANSHIP, COMMERCIAL LAW, COMMERCIAL ARITHMETIC, CORRESPONDENCE, MODERN, LANGUAGES, Etc.,

Practically taught. —

This College forms a link of the American Chain of Commercial Colleges.

Located in the principal cities of the United States, and is the only institution on the Pacific coast conducted on actual BUSINESS PRINCIPLES.

Regular Banks and Business Offices have been introduced.

By which we are enabled to fit out Students in the BEST POSSIBLE MANNER, and at the LEAST EXPENSE of time and money, for the practical duties of the Counting House.

Students can enter at any time of the year, there being no vacations. Each student receives individual instruction, with the exception of Lectures and other general exercises.

The College Review,
Giving full particulars of the College, can be had FREE, by calling at the College, or addressing

3v13 President Business College, San Francisco.

SANTA CLARA COLLEGE, S. J., SANTA CLARA, CAL.

Conducted by the Fathers of the Society of Jesus.

The SIXTEENTH ANNUAL SESSION of this College will commence on

Monday, August 20th, 1866.

TERMS—Tuition in the Classical and Scientific Department; Boarding and Lodging; Washing and Mending of articles washed; School Stationery; Medical Attendance and Medicine; Fuel, light, baths, etc., per session of ten months. \$350

For further information and catalogues, apply to the President of the College, or to Rev. A. Maraschi, St. Ignace College, Market street, San Francisco.

3v11-12 REV. A. MARASCHI, S. J., President.

SAN JOSE INSTITUTE

Commercial College,
SAN JOSE,
Santa Clara County, California.

THE NINTH SESSION WILL COMMENCE ON THURSDAY, July 26th, 1866

A new, practical and complete Business Course has been adopted. It differs from all others in that it is designed to give the student a thorough, practical Business Education, to this fact, and request them to send for a Circular before deciding whether they will pay out.

Ample accommodations for boarders in the Seminary. Ornaments, Music, Ancient and Modern Languages taught.

Special arrangements have been made for boys between the ages of ten and eighteen.

For further particulars or Circular, address
FREDMAN GATES, Principal.

Mining Summary.

CALIFORNIA.

Alpine County—

From the *Miner* of September 8th, we clip the following: Two samples of rock taken from two different claims in Monitor district, just below town, were assayed a few days since. We give the certificate in full, as follows:

"Assayed for J. P. Ray two samples of ore. No. 1 contains, per ton of 2,000 pounds, silver, 152.09 ounces—value, \$199.02; gold, 1.215 ounces—value, \$25.11; total value, \$224.13.

No. 2 contains, per ton of 2,000 lbs., silver, 709.56 ounces—value, \$922.42; gold, 1.215—value, \$75.33; total, \$997.76. . . . The American company are down over forty feet with their new air shaft, and expect to intersect the drift within the coming week.

The Silver Mountain *Bulletin* of same date has these items: We have an intimation from a reliable source that the Northwestern California company, who have leased Buckeye No. 1 for six years, will commence operations by the 1st day of October. . . . The workmen in the George Washington mine, in straightening the tunnel so as to intersect the cross-cut made to strike the east wall, struck the ledge on Wednesday north of the former workings. The ores from which appear richer than those taken out of late. . . . A contract was let by Lady Elgin company, last week, to Messrs. Mylett & Carmichael, to run seventy-five feet, or to the ledge, and three feet into the same for \$6.50 per foot. . . . On the Coast Range lode, Philbrick & Co. have two shifts running a tunnel, which is now in forty-four feet, and about sixty feet beneath the croppings. . . . Mr. Guido Kinstel arrived at the Washington mill on Wednesday evening, and will assume the control of the works.

Amador County—

The *Ledger* of September 8th says: We have been shown a couple of specimens of very rich silver ore, so rich that the heat of an ordinary forge quickly covers it with globules of silver. The luster says he obtained it near the Mokelumne river, on the Pine Grove range, but refuses to disclose the exact locality.

Calaveras County—

The *Chronicle* of September 8th says: Several new quartz leads have been discovered in this vicinity within the past two weeks. Near Middle Bar, on the Mokelumne river, George Smith recently found a large, well-defined ledge, the top rock of which prospects handsomely. A company has been organized and work commenced. From Railroad Flat the news continues cheering. Rock from all the claims has been taken to Harris' mill and crushed, and in every instance the result has been most gratifying.

El Dorado County—

A new quartz mill is being erected at Wall's diggings, by William Milgate, of 10-horse power, and will run five stamps—the stamps weighing 280 pounds each, independent of the shaft.

Kern County—

The *Visalia Delta* of September 5th has a letter from Poe's Camp, Kio Bravo district, Kern county, dated August 27th, from which we extract the following: The General Washington lode runs over a hill near this mining camp, and two shafts six feet wide have been sunk. The lode is over seven feet wide. It stands nearly perpendicular, and promises to be among the best, if not the very best mine in this county.

We have also found quicksilver or cinnabar mines. Two of them show in the out-croppings the largest amount of cinnabar of any mines of that class in the State. They crop out on the summit of a high ridge, of land, and are easy to approach and work. The largest cinnabar mine is three miles from here.

Several of the lodes are within ten miles of Kern River, where there are good waterfalls. In fact, taking into consideration the climate, and the easy access to the several gold-bearing lodes, it is certainly the most pleasant and perhaps the richest mining camp in this portion of California.

The Rio Bravo Mining district adjoins Long Tom and Clear Creek.

A new district has been organized at Hot Spring Bar, called the Dablonega.

Mariposa County—

The *Gazette* of 8th instant says: The Bear Valley mines are paying better than ever before. The rock at the Pine Tree and Josephine veins average from thirteen to sixteen dollars per ton, and the veins are extensive enough to warrant their holding out as long as any one will want to work them.

From the *Alta* of the 12th we clip the following: To make assurance "doubly sure," the managers of the Mariposa Estate continue to make experiments with the new process of working gold quartz rock. Twenty-two tons of ordinary rock from the Pine Tree mine were treated last week, and the result proved much larger than the most sanguine anticipated,

being \$918.48, or a fraction of \$42 per ton. If the experiments, which are to be continued, increase the yield of the precious metals at this ratio, we will see a revival in the gold quartz mining interests of the State.

Nevada County—

The *Gazette* has these items: The owners of the Italian ledge recently commenced suit against Fleming and others, to establish title to the mine, which it seems both parties claim and which both parties have been working. The Italian company have sunk a shaft to a depth of about ninety feet, from which they have been taking out rock. Fleming & Co., also, have run a tunnel into the shaft just mentioned, and by a free use of sulphur and other compounds—such as it is supposed Satan uses in his dominions—have smoked out the Italian party for the time being. An "underground" quarrel is likely to result from it, as we learn that the Italian company have covered over the top of their shaft, so as to drive the sulphurous odors out through the tunnel.

We had a conversation yesterday with J. A. Fuller, just down from Eureka township, who informs us that times are unusually lively in that locality, and the quartz mining prospects are remarkably encouraging. The Lambert mill, near the town of Eureka, is about completed, and will have five stamps running next week. The Black mill, erected on the Young ledge, is rapidly approaching completion, and will be running in two or three weeks. The owners have out a considerable quantity of rock ready for crushing. Keller & Co., owners of the Eclipse, have struck the ledge in their tunnel. The tunnel has been run about two hundred feet, and the ledge is of large size, and the rock looks well. The Kentucky company, at Snow Point, are about to commence operations in sinking for the Blue lead. They have a large engine on the ground, brought from Silver Mountain, and the machinery will be put up immediately. The town of Eureka is now quite lively. Moore's Flat is also improving.

The Grass Valley *National*, of Sept. 6th, says of the Cape of Good Hope: This mine is situated in Rhode Island ravine, about a mile from town. It was located last June, and has been worked ever since by the present owners. They have sent an agent to San Francisco, to negotiate the sale of one half the mine.

The same paper has an editorial on "the future of Grass Valley," from which we quote: Our mines, many of them, unlike the Washoe mines, are worked by the original owners, who, instead of spending their money away, retain at least a portion of it here in improving and beautifying the town, which they intend as their future homes. On the hillsides, surrounding the town, houses are going up in every direction, while, throughout the business portion of the town large and substantial brick buildings are being erected on every street. All this is the legitimate result of the richness of our mines and the industry of our people, and not the effect of feverish excitement.

EXCELSIOR.—We clip the following items from the *Meadow Lake Sun*, of Sept. 6th: Four and one half tons of rock from the Enterprise ledge are now are about to be worked by the chloridizing process of Messrs. Chapellet & Ditken, at their Metallurgical Works. . . . The Colima Company, Colima ledge, are working about one hundred yards north of the Knickerbocker. They have sunk about twelve feet on the ledge, which seems to widen as they go down. The lode prospects very rich in gold and sulphurets. . . . There is a constant demand here for experienced and industrious miners.

The *Gazette* says: A practical miner, who spent most of the summer at Meadow Lake, informs us that the most serious drawback to the development of the mines of that district is the want of roads for hauling quartz from the ledges to the mills. The country is very rough and broken.

Placer County—

The *Herald* of Sept. 8th, has this item: The prospectors of the Mallet claim commenced on Monday last to sink deeper on the ledge. The "indications" are better and better. The vein continues to bear a great deal of sulphurets. Some of the rock was recently worked by mill process and yielded \$76 to the ton.

The *Folsom Telegraph* of same date, says: The Golden Rule company, whose quartz claim is situated near Horseshoe Bar, Placer county, have a fine mill completed, and have about one hundred tons of excellent rock ready for crushing. The company are elated with their prospects. We are informed that rich quartz discoveries are continually being made in the lower portion of Placer county within eight or ten miles of Folsom.

Specimens of ore taken from the Maine ledge, owned by Davenport & Co., near the Bloomer Cut, between Newcastle and Auburn, were assayed recently by Waters, of Sacramento, and yielded at the rate of \$2,285.06 per ton in gold and \$138.48 per ton in silver—total per ton, \$2,423.54. This ledge is located on the line of the Central Pacific Railroad.

The Dutch Flat *Enquirer* has the following: Bradley and Gardner are making preparations for conveying water from the line of their ditch to Thompson's and Gray's Hills, in sufficient quantity to accommodate the miners on both those hills. To accomplish this object they have ordered four thousand feet of iron pipe thirty inches in diameter. The enterprise will involve an expenditure of some \$28,000.

Plumas County—

We clip the following from the *National* of the 8th inst.: The work of prospecting the Union ledge, lately struck by Messrs. Bidwell & Co., was a heavy undertaking. The shaft was sunk through bed rock a distance of 225 feet, at a cost of \$10,000. The company now expects to receive ample returns for this expenditure. . . . Messrs. Rogers, Abbott & Co., comprising the Norway Company, are having fair success in opening their ledge, on North Canyon Gulch near Greenville. They have sunk a shaft about 40 feet and have found excellent pay. Last week the rock which they crushed paid \$20 per ton. They are now taking out rock which will pay from \$25 to \$30 per ton. . . . The Caledonia ledge, at Round Valley, owned by Messrs. Bidwell & Co., is being prospected with success, paying last week \$18 per ton.

Sacramento County—

The *Folsom Telegraph* of 8th inst., says: A new quartz mill is being erected at Wall's Diggings, in this county, by William Milgate, of five horse power, and will run five stamps, the stamps weighing two hundred and eighty pounds each, independent of the shaft. Mr. Milgate has been running two arastras on his ledge for a year past.

Shasta County—

The *Courier* of the 8th inst. has these items: Mr. George McKean has sent us a sack full of rock from his ledge on Flat Creek, which not only looks well, but is pronounced very rich by competent quartz men. McKean says there is a number of ledges on the creek which prospect equally as rich as the one he has located. . . . John S. Hale, Superintendent of the Kellenger mine, reports no new indications on striking the ledge. Rock continues very hard and cannot be got out except by blasting. The tunnel is in a distance of 1,030 feet. . . . The Mammoth company have just completed a run of thirty-three tons of rock from the Harrison ledge.

Sierra County—

The following items are from the *Mountain Messenger* of the 8th inst.: The rock being taken from the Sailor claim is richer than ever. . . . The Keystone is improving in depth, with strong vein and rich ores. . . . The Oro claim is sinking a shaft through average thirty-one dollar rock. . . . The recent discovery of a new belt of cupriferous ore about four miles east of the Buttes, bids fair to turn out very valuable. . . . Rich discoveries have been made on the North Fork near Rattlesnake. Some ore brought to town shows very rich. . . . The Sierra Buttes mine is working a 22 feet breast from wall to wall. It resembles more a huge quarry than working a vein of quartz. The ores are rich. . . . The Spanish claims, opposite Clements' saw mill, on the South Fork, are being reopened. The vein is about eight feet thick, with a good class of ores in sight. . . . The new process adopted by Gray & Co., at Gold Valley, is proving a decided success. Ores that heretofore would not pay for working, are now paying largely. . . . The Good Hope was running a low adit which will tap the vein down 200 feet below the croppings, affording heavy backs. They are crushing in the Gold Bluff Mill, ore paying about \$35 per ton.

The Chappai Quartz Claim, situated about one mile northerly from Downievale, near the Monte Cristo trail, has been heretofore worked as a placer claim, being in a talcose formation, which is much decomposed near the surface. Water, with the help of the pick, has heretofore been quite sufficient to free enough of the gold to make it a very remunerative property to the owners. Recent developments have proved its continuity in depth, with a very rich class of auriferous ores. The ores now being quarried are so rich that the proprietors are packing them to put away for sale. . . . George Knowles' claim, in the river, at the toll-bridge, has yielded this season about \$10,000, working ten men. This is at the rate of about \$166 per day to the hand.

Letter to same from Chip's Flat says: Sayles & Stockwell took out of their claim last week the snug little sum of \$1,200. . . . The Branch Company of Centerville, have consolidated with the Mammoth Tunnel company, at this place, whose tunnel, it is expected will be low enough to drain the back ground in the center of the ridge, under the road leading from this place to Minnesota, and the enterprise will, no doubt, be a paying adventure. . . . The Morning Star company are running the main tunnel to their back ground with every indication of success. . . . The Yankee are having their regular dividends every week. . . . On the Minnesota side the Keystone and Wisconsin are paying well.

Siskiyou County—

The *Union* of Sept. 8th, says: The mill of Dash, Hawkins, & Co., cleaned up, after a six weeks' run, and obtained \$3,000.

The *Journal* has the following: "The ledges on Humbug creek are creating some excitement lately, and promise to be good paying institutions. The Siskiyou ledge being now principally owned by San Francisco capitalists, it is the intention to erect a quartz mill. The Shasta Butte Company are working on another part of the same lead, and have lately taken out very rich rock, some of which will be shipped to San Francisco for testing.

Tulare County—

The *Visalia Delta* of Sept. 5th, says: We are burning a beautiful article of coal oil from the Buena Vista Company's Works, near Buena Vista Lake, in this Valley. The Company is prepared to manufacture 3,000 gallons per month of this, besides a large amount of lubricating oil. They report the supply to be apparently, inexhaustible. They think they can lay down their oil here at one dollar per gallon, and expect to supply all the country this side the Coast Range. The oil is as clear as crystal, slightly tinged with an amber shade, (though much of it, we are told, is perfectly free from color,) limpid as water, and burns with brilliancy.

Tulame County—

The *Columbia Citizen* of the 8th inst., gives the following items: The Ino realized ten ounces from last week's work. This claim is one of the vacant lots in our city, for which the proprietor was recently offered the sum of two hundred dollars, but preferred to prospect it. . . . The owners of the Daly claim, located in Main Gulch, Columbia, cleaned up, last week, upwards of thirty-one ounces of gold.

Yuba County—

The *Appeal* of Sept. 6th, says: Our Brown's Valley correspondent informs us that the steam engine in the Donnebroke mill has broken down, and the mill at a stand still. Also, that the Rattlesnake has struck richer rock than was ever taken out in the town, and the Pennsylvania paying better than ever.

NEVADA.

Washoe—

The *Gold Hill News* of Sept. 6th, says: A change is about to take place at American Flat. A portion of the Mont Blanc mine has been sold to a New York company who are now prosecuting work with three "shifts" of hands to find what has not yet been done—the extension of the rich Comstock ledge. There is a tunnel 400 feet in length. The ledge is supposed to be eighteen feet in width where the tunnel cuts it. A shaft is being sunk on the ledge, and is now fifteen feet deep. The ore as it is taken out has good sulphurets indications, and is growing more solid and promising as the sinking of the shaft progresses. Assays show from \$5 to \$40 per ton.

The *Enterprise* says that the Savage mine yields at the rate of over a thousand tons ore per week, worth nearly \$50 per ton.

Reese River—

The *Reveille* has the following items: Important discoveries have been made near the southern boundary of Northumberland district. Two large ledges, the Green Mountain and the Indian Queen, have been opened. The former is thirty feet, and the latter fifteen feet thick. . . . We have been shown a certificate of assay of ore from the Keystone ledge, in Hot Creek. It yielded at the rate of \$21,918.94 to the ton. Of course it is not pretended that this is a fair sample of the ore, but as a very rich specimen of it. As large as it is, it has been excelled in Lander district. In 1864, an assay of ore from the Warner & Wells, which gave \$22,518.98 to the ton. . . . Mr. J. Bowstead of Sacramento, will shortly take charge of the affairs of the Manhattan company. They own three ledges, the Oregon, North Star, and Southern Light. It is believed the change will be for the benefit of the district. . . . Mr. Stamford, of the old Colony, has been appointed superintendent of the Harvard company, Yankee Blade. He is now working the Josephine ledge. Seven and a quarter tons of ore from the Childs and Caulfield location on the Transylvania ledge, in the Philadelphia district, have just been reduced at the Keystone mill, with a yield of bullion valued at \$1,170.82—over \$161 per ton. . . . Bullion shipped in August from Austin, was \$71,000. . . . Colonel D. E. Buel arrived in town yesterday, Sept. 2d, from the Philadelphia district, with several thousand ounces of crude bullion, being the first lot reduced at mill in that district. It is less than ninety days since he first visited the section for the purpose of examining the property which he now owns. Within that period he dismantled and removed a 10-stamp mill from Bar creek to the Philadelphia district, more than one hundred miles distant, rebuilt it there, and produced bullion before the close of August. . . . The mill of the New England and Nevada company at Kingston, will be completed the first of October. It will be supplied with twenty stamps and four furnaces.

The same has an editorial on "Austin as a Railroad Center," predicting its future import-

ance, and giving the probable routes to be followed by the railways, that must in time be built, of which the natural center is at Austin. The passes, and natural grades, and perfect plains, are said to be singularly favorable for cheaply connecting, by railroad, most of the richest districts with each other, and with San Francisco.

The Nye County News of Sept. 1st, has these items: In Mammoth district, everything is lively. The Mount Vernon company are still pushing work on their mines, and the Hamilton company, recently organized in Philadelphia, are soon expected to commence operations. At the Knickerbocker mill, we saw a fine specimen of ore from the Great Eastern claim, at Grantsville. It contained a leaf of native silver, the most beautiful we ever saw. The Great Eastern is looking well, and a large force is constantly getting out ore. Messrs. Boon and Hawk have gone east to sell the Knickerbocker and Erie series of ledges in Mammoth district, or to raise a company to develop them. They are not "wild cat."

Letter to some from Austin, says: Silver Glance ledge, Hot Creek, assayed \$1,689 per ton. From what I can learn here of the recent discoveries in Silver Bend, Hot Creek and Reveille districts, and from experienced prospectors now exploring that section of country, I will venture to predict that five years hence Nye county will stand ahead in population and mineral wealth of any other county in this State.

Emeralds—

The Union of September 8th has this item: A very rich gold-bearing quartz ledge is reported to have been discovered recently on Dog Town Creek, near Monoville. It has created quite a stir among prospectors.

Humboldt—

The Register of 1st instant has the following: Work has been resumed on some of the old claims in this district, which have been wholly or partially abandoned during the last two years, and, in some instances, the results obtained by a few weeks' labor judiciously expended, are beyond the most sanguine expectations of the prospector.

We will give the Arizona as an example. Since '63 barely enough has been done to hold it in accordance with our district laws. Three weeks ago a few of the owners commenced a search for the ledge. A fair-sized vein of mineral has been struck, from which enough ore has been extracted to cover all expenses and leave a margin for future operations.

Same paper of 8th has a letter from Humboldt City, from which we gather these items: The tunnel in the Starlight, of the Atlantic and Pacific company, is in 363 feet. Five men are at work day and night. In the Calaveras a tunnel 346 feet in length has been run, and a shaft has been sunk to the depth of forty feet. The mineral in this large vein is of a peculiar character, crumbling between the fingers like wet powder, and of a similar hue. The ore is exceedingly rich, assaying as high as \$5,000 per ton, but not as yet found in quantity sufficient to justify the erection of reduction works.

Same paper has an editorial headed "Effect of Incorporating in San Francisco." It cites the Peru ledge, in Buena Vista district, to show how things were done in 1863. The company was incorporated, an assessment levied, an "artist" sent on as superintendent, and a shaft of fifty feet sunk. At that depth water was struck, and not a cent has been expended on the claim since, although they abandoned a 5-foot ledge of ore assaying from \$100 to \$1,100 per ton.

Pahranaagat—

A letter from Logan Springs to the Salt Lake Volante says: The climate is delightful, and the mines can be worked the year round—very little snow or cold weather to impede operations. It is of as much importance to the mining interests here as it is to Utah and Nevada, that the Colorado should prove navigable to Callville, if no further. Dr. Conger and Mr. Raymond evidently believe it to be so, for they purchased at that city mills and machinery, with stocks of miners' goods, and contracted with responsible shippers for the delivery of the same at Callville about the 1st of September. Several lodes in the district are excavated to the depth of twenty or more feet, and display well defined walls with broad vertical veins of ore that assay from one hundred to five thousand dollars per ton. Machinery for operating these mines can be very readily obtained, having to be transported by land only about one hundred miles, and that over a good road directly up the Pahranaagat Lake Valley.

ARIZONA.

The Miner of August 8th says: It is reported that the Groom and E. M. Smith interest on the Bully Bueno mine—nine hundred feet—have been sold to the Philadelphia company for ten dollars per foot, and that the mill sent out by said company will be put upon it. The Governor and Adjutant-General recently made a trip to Big Boy district. They visited the Golden Wreath, Ticonderoga, Green

Tree, Galena, and Big Bug lodes, and then proceeded to the Borer Mill. Though not running at the moment, it was started for their inspection and worked admirably. At the Woolsey water mill three of the five stamps were running.

The Alta of 10th instant has a letter from Hardyville, dated August 19th. The writer says: We have at length two real quartz mills landed at this place, one of which, that of the Moss association, will be crushing within ninety days. It is a first-class 10-stamp mill, with pans and gold and silver-saving appliances all complete. The other mill is one of the "Thunderbolt" pattern, and is claimed to be able to crush twenty-five tons of rock in twenty-four hours. It was shipped here from New York city by Mr. A. Wade, for the San Francisco district. Mr. C. L. Strong, superintendent of the Moss mine, has the walls of the building that is to contain their mill nearly complete.

It is known that the Moss lode has rich croppings, and a shaft of eighty feet proves rich ore at that depth. The Dayton, close by, can be made to yield some pay rock. The Michigan can furnish hundreds of tons of good ore at short notice, say of \$40 to \$100 rock. The Parsons yields good ore. The Queen of the Pacific company have a tunnel in 160 feet, and have found very rich rock. The Invincible company can always produce paying ores for crushing.

Work still progresses, new companies are taking hold, and faith in the richness and permanency of our mines wax stronger. Colonel Aiken, assayer for the Pennsylvania company, that made a disastrous attempt at mining here two years ago, has just returned for the purpose of operating in the Sacramento district. The Colonel assayed enough ores and observed enough of the country while here to satisfy him that there are rich and good mines here, and notwithstanding the failure made by his company, through inexperience and bad management, his faith has brought him back again, prepared to profit by the knowledge he obtained of the mines here. Mr. C. A. Luke, an old prospector, has also just returned from the East with an outfit for opening some of the ledges of the Sacramento district. Several companies have commenced work in that district.

COLORADO.

From the Denver News of August 29th we clip the following: We have been shown some extremely rich assays from some of the silver lodes belonging to the Ute Mining company, in Pacific Lake district, near Breckinridge. One assay from lode No. 1, from a tunnel twenty feet from the surface, assays \$23,421.91 per ton of 2,000 pounds. Another from the blossom rock of lode No. 3 east, in the same district, assays \$4,708.20. The assays were made by Mr. Schirmer of this city. The company is getting out a large amount of ore, and we believe propose erecting reducing works at an early day. The Argentine company are working the Paymaster lode. The works consist of an Atwater oxidizing machine, the only one in the country, and a Scotch hearth. They are on a small scale, and are as yet regarded as an experiment.

Ward mining district is unquestionably one of the richest in the Territory. The Ni-Wott mill has fifty stamps. Twenty-five of these were started on the 16th of last month, running on surface and refuse ores, from which the best qualities had been selected before, yet the result of fourteen days' run was a yield of one hundred and twenty-two ounces of gold coin value sixteen dollars per ounce, equaling \$1,952 in gold. The second run was only four and a half days, from a better class of ores than before used, still not the best average of the mine. In this run seven and a half cords were worked, giving a yield of twenty ounces and six pennyweights to the cord, being an average per day of gold, at coin value, of \$542.20. This, when the whole fifty stamps shall start, will be just doubled, making \$1,084.40 in coin, and at present rates \$1,500 currency value per day. The cost of mining and milling per day will be \$170, leaving \$1,320 net profit to the company for each day's run. The mill is built on the Columbian lode, which has a crevice of ten feet between the wall rocks. All of this material is worked, the poorest yielding about \$70 per cord under stamps, and the best selected ores, which are abundant in the mine, not less than \$500 per cord.

IDAHO.

The Avalanche of September 1st has these items: In the Whisky Gulch ledge the main shaft is down seventy-five feet, at the bottom of which a tunnel is run north thirty-five feet. The ledge in this tunnel will average four feet. Next to the east casing there is fifteen inches of rich quartz. On the west side there is another equally rich but smaller stratum. It promises to prove a first-class ledge. Moore & Fogus have failed. The extent of their liabilities is probably between two and three hundred thousand dollars. On the 14th day of August the property was transferred to the Minear Mining and Milling company, for the

sum of \$156,000. We are informed that C. E. Tilton, of New York, held a mortgage on the mill, adjacent buildings and grounds upon which they are situated for \$36,000. The editor says: "The failure was not in any sense the result of the unproductiveness of the company's mines, and of this fact we desire the outside public to be as well assured as we of Owyhee. Mr. Lobeneau, Mining Engineer and Assayer, reports that the miners now working at the Pueblo copper mines have just discovered a silver ledge five feet wide, which is pronounced a sulphate of silver—containing eighty-five per cent. of pure silver. The Pueblo mines are located on the Chico stage route, and about 150 miles from Silver City. It is on the same range of the Black Rock, Pine Forest district, and where the ores have been successfully worked by the mills of Virginia City and Washoe."

MONTANA.

The Post of August 18th gives the following items: L. H. Lusk, in Alta Gulch, has in his employ about twenty men, and is taking out, on an average, three hundred dollars per day. Messrs. Hedges & Co., who own the claim below Mr. Lusk's, took out, on last Thursday, \$229, being the first clean-up they have made since opening their ground. In this claim, from one pan of dirt, four dollars and fifty-seven cents were obtained. Brown's Gulch is paying from fifteen to twenty dollars per day to the hand. Only a few men are, as yet, working. In Summit Quartz District the Nelson ledge exhibits, at the depth of seventy feet, a crevice seven feet in width, of rich paying rock. The Yankee Blade has a shaft some fifty feet in depth. The Kearsarge is well developed, having been tapped at the depth of one hundred and twenty feet. The Keystone prospects finely at the depth of sixty feet, and shows a well defined crevice. There are four quartz mills in the vicinity of the town, nearly all of which are in running order. The Seneca Falls mill is a very large frame structure, and is said to have fine machinery. The Scrauton mill is a Dodge crusher, with all the latest improved amalgamating apparatus. The Excelsior is a very large mill of stone, and has twenty stamps. The Idaho was the first mill brought into Madison county, but has never been successful. Another mill is in process of erection in this district. The company at work on Discovery claim are taking out about twenty dollars per day to the hand. Some little excitement was created last week at the Mountain Spring ranch, kept by S. B. Goodrich, by the finding of some rock in the hills adjoining the ranch, which was nearly full of gold.

The Bannack letter to same says: The Butterfield company, on No. 6 Dacotah, has a shaft over 300 feet deep, and a drift thirty feet long. Free gold is visible in the rock. * * Every body is at work. The New York mill, which has lain idle for a year and a half, has been repaired and started. Messrs. Wright, McMeen & Co. have recently made a new discovery at Bald Mountain, which, without any doubt, is the best gold lode of that district. The crevice is three and a half feet in width, and is a well defined vein of quartz.

New diggings have been discovered near the head of Bitter Root river. The Mullan road is now traveled by wagons.

Same paper of 25th August has these items: On Monday last, Messrs. Boyd & Co., who own claims near Nevada City, in Alder Gulch, made a run of 24 hours, and cleaned up \$1,500, being a little more than an average run for the same length of time. We were shown, at the bank of Hussey, Bahler & Co., on Wednesday last, thirty two ounces of amalgam, which was taken from a ton of rock that came from the Alameda quartz lode. The Seneca Falls mill is at work on ore from the Kearsarge. Nine quartz lodes have been recorded this week, all of which are located in the immediate vicinity of this place.

Letter to same from Bannack, August 20th, says: A stampede commenced yesterday for the Lemhi Valley new diggings. They are said to prospect from seven to thirty cents to the pan on the bed-rock. * * The Montana Mineral Land Mining company are employing a score of men sinking shafts, building foundation for a 20-stamp mill, getting out timbers and other material for a mill, and three sets of furnaces. The building for the mill will be one hundred by thirty feet, and put up in the most substantial manner. This company own several ledges—the Mademoiselle, the Dacotah, the Arizona and others.

Letter to same from Helena says: Mining is carried on in the old way in our neighborhood. The thirsty gulches are waiting for the Ten Mile ditch, which is well nigh completed. Prof. Hodge's mill, in Oro Fino gulch, will probably be in running order in three or four weeks. New York Gulch is rather dull, but the quartz in that vicinity gives encouraging promises. A new lode has been discovered on Trout Creek, about two miles from New York, which is said to be very rich. Rich diggings have been found in the Bear's Paw Mountains.

Republican of August 18th has the following: The mill of the Bullion company will arrive next week, and will be placed upon the New York lode. This mill has three Bullock's crushers with the capacity of fifteen stamps. The building is all ready for the reception of the machinery. The East Bannock company's mill commenced operations one week ago. A grand time was had on the occasion.

From the Radiator of the 11th of August we clip the following: Judge Turnley's mill is crushing quartz from the Park lode, and the last "clean-up" yielded \$1,739, being an average of \$46.50 to the ton. Many people are leaving for the "States" by way of Fort Benton and the Missouri River. It is estimated that within the last three weeks not less than five hundred well armed and well provisioned men have left here in small parties to prospect the Big Horn and Wind River Mountain country. Among these parties are many good miners and old prospectors. Blackfoot correspondent says: A good deal of excitement prevails here as to the richness of the Wind River country. A party of twenty men left here yesterday, and others are still going whenever they get a party strong enough to venture in that Indian country.

The Helena Republican asserts that a ton of gold was lately unloaded at the banking house of Hershfield & Co. in that city. The gold belonged to two men, and was taken from Montana Run, Confederate Gulch, in less than four months.

BRITISH COLUMBIA.

The Victoria Colonist of August 8th says: A private letter from Leech river states that the writer has prospected the Kokesies river, and found 100 colors to the pan. He then crossed the headwaters of the Leech, where he discovered a prairie 1,000 acres in extent, from which he thinks the gold has been washed down, and he purposes to thoroughly prospect the ground. Should this theory prove to be correct, a new era would dawn for Vancouver Island. It is said that a California company have obtained a controlling interest in the seam of coal recently discovered at or near Comox, by Mr. Teidman, and that they design opening it at once.

THE ENGLISH COAL COMMISSION.—The Queen of England has finally appointed a Board of Commissioners to investigate the probable quantity of coal, available for uses in the coal fields of the United Kingdom; whether it is probable that coal exists at workable depths under the Permian, new red sandstone, and other superincumbent strata; to inquire as to the quantity of coal at present consumed in the various branches of manufacture, for steam navigation, and for domestic purposes, as well as the quantity exported, and how far, and to what extent, such consumption and export may be expected to increase; and whether there is reason to believe that coal is wasted, either by bad working or by carelessness or neglect of proper appliances for its economical consumption. The Commission consists of the following named persons: The Duke of Argyll, Sir Roderick Impey Murchison, Sir William George Armstrong, Henry Hussey Vivian, Esq., George Thomas Clark, Esq., Joseph Dickinson, Esq., George Elliot, Esq., Thomas Emerson Forster, Esq., John Geddes, Esq., Robert Hunt, Esq., John Bete Jukes, Esq., John Hurlley, Esq., John Percy, Esq., Doctor of Medicine, Joseph Prestwich Esq., Andrew Crombie Ramsay, Esq., and John Thomas Woodhouse, Esq.

HOW TO SILVER COTTON CLOTH.—Cotton cloth, or thread, may be silvered in the following manner: Dissolve one drachm of nitrate of silver in six to eight parts of hot distilled water, and add gradually a sufficient quantity of liquid ammonia to re-dissolve the precipitate first formed. This solution is to be mixed with a thickening material, and may be printed in the usual way upon the cloth, which, in a moist condition, must be placed in a well-closed room, and exposed to the reducing action of hydrogen. The silver will appear in its peculiar metallic brightness, which may be increased by rubbing or burnishing the printed spots.

MOHAMMED SAVED BY A SPIDER.—When Mohammed, exposed to the wrath of his enemies, fled from Mecca, in company with Abubakar, they took refuge in a cave of Ther, where the two fugitives concealed themselves for three days. His pursuers, coming to the cave, found that a spider had woven a web across the entrance, from which circumstance they judged that no one could have recently entered it. They accordingly retired without examining the interior, and the prophet and his companion afterward escaped in safety. But for that spider's web, Mohammed had lost his life; and his career terminated only to be dimly written on the page of history.

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. Thomas Starr is Agent for the MINING AND SCIENTIFIC PRESS in Nevada, and will canvass the principal cities, towns and districts of that State. August 25, 1866.

Mr. O. P. Truedell will act as our Corresponding Agent and Solicitor, in the interior of this State, from this date. August 25, 1866.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. SAN FRANCISCO, Jan 14th, 1866.

Mr. I. N. Hudson, is authorized to solicit subscriptions, advertising, etc., for the MINING AND SCIENTIFIC PRESS, in San Francisco, and to receipt for the same.

SUBSCRIBERS who do not receive the MINING AND SCIENTIFIC PRESS in due time, are requested to inform the publishers.

San Francisco:

Saturday Morning, Sept. 15, 1866.

THE RYERSON PROCESS.

The Ryerson process, for which the New York agent of the Mariposa estate has claimed such marvellous results in its application to some of the ores of the Josephine mines, was introduced into this State by the inventor some four years ago. It was mistake not, this machine was first put into operation upon the Mariposa estate, where an unsuccessful attempt was made to work some tailings which had been lying for some years exposed to atmospheric influences. The chief cause of the failure was attributed at the time to certain chemical changes, which, it was asserted, the tailings had undergone, and which operated unfavorably on the quicksilver used for amalgamation. The true reason was, probably, due to a lack of a full understanding of the nature of the process.

Two of the machines were subsequently put up in this city; the impression their working made upon the minds of quartz operators, may be inferred from the fact that several of the machines were soon after ordered for various parts of the State. Two of them were put up in Grass Valley, neither of which, however, run for any considerable length of time. The reason, therefore, we have understood, to be this the very good one—the insufficient quantity of gold in the rock. About the same time another machine was taken to San Bernardino county, where it was operated for a year or more with very fair results. Soon afterward, still another one was put up, if we mistake not, in Tuolumne county; but the latter machines were set in operation under the direct supervision of the inventor, Professor Ryerson. Of all that have been in operation, none, unless we except the one last used on the Mariposa estate, are now in operation.

Various kinds of crushing apparatus have been attached to these machines; any description of which will answer, provided the crushing is done thoroughly and dry. The distinctive feature of the process, is the use of superheated steam, as an aid to amalgamation. This is accomplished by first placing the crushed quartz in a kind of an upright steam boiler, in the bottom of which is placed a coil of perforated steam pipe, into which is conducted a flow of superheated steam, which is liberated in the midst of the quartz that overlies the coil. It is claimed that the hot steam instantly vaporizes the quicksilver, which ascends to the top of the boiler where it meets a surface cooled by the application of cold water upon the outside, and by which it is condensed and falls to the bottom, to be again and again vaporized as before. In the meantime the pulverized quartz in the bottom of the boiler is kept in a constant state of agitation by the rush of steam, and the gold more readily amalgamated by the vaporized quicksilver. The time required for amalgamation is about twenty-five minutes, and some 800 pounds are worked at a charge. By opening a man-hole

in the bottom of the amalgamator, the quartz is allowed to drop into any kind of a separator which may be desired, when the amalgam and quicksilver is readily collected.

The great desideratum for this process is to secure a fine and dry pulverization of the quartz. Several modes have been adopted, but that which would appear the most practicable, is the use of stamps with a fan exhaust, by which the quartz is delivered in the shape of an impalpable dust into a large chamber, from whence it is removed, for treatment with the superheated steam. The great drawback to this process is the difficulty of ventilating the chamber, or finding an escape for the air without losing, at the same time, a large amount of the quartz dust.

Messrs. Rounds & Strong, of this city, have recently patented an ingenious device for remedying this trouble, which consists of a kind of double chamber, the inner one of which is intended to receive the escaping air, with its accompanying dust, through a narrow funnel-shaped opening, into the throat of which is at the same time introduced a small jet of steam, by which the dust is saturated, and as the steam is condensed by means of a system of condensers, it is deposited in a receptacle at the bottom of the chamber, from which it is readily removed and dried for treatment. This mode of crushing, we should think, is far ahead of that adopted at Mariposa, which, in our opinion, would be most applicable to very soft material—it being first designed for reducing chert for the manufacture of gunpowder.

Another expedient was adopted with considerable success at San Bernardino, which consisted in placing a steep roof over the chamber, with low, hanging eaves, spaces being left between the roof and walls for the escape of the air. The peculiar current formed in the chamber had a tendency to deposit the dust on the floor, with very little loss through the openings.

We should be inclined to question the great disparity of yield between the old process and Ryerson's, as given in the late report of the New York agent of the Mariposa estate; yet, there can be but little doubt that better results have been obtained than by the process heretofore adopted, from the fact that the superintendent has, within a few days, ordered two other machines for the Josephine mine, one of which will be run exclusively upon tailings. The bullets used in these machines are cast of white iron, and are made, with the cylinders, at the Golden State Iron works.

MANUAL OF BLOWPIPE ANALYSIS.—We have received from H. H. Bancroft & Co., a copy of "Elderhorst's Manual of Blow-pipe Analysis and Determinative Mineralogy." It is adapted to the use of the beginner; and seems to us to supply, in a compact form, all the information necessary for the performing of most operations for the determination of minerals, which is contained in more extensive and more elaborate works. With this book, a blow-pipe, and a few pieces of borax and other re-agents, one can test almost any piece of rock sufficient to determine its composition. This present, which is the third edition, is made especially applicable to those species of minerals which occur on the American Continent, and contains one chapter which does not appear in former editions.

AUSTRALIA, for instance, where, according to Mr. Hopkins, a distinguished mining engineer, the Black Hill Company, with a paid up capital of \$120,000 coin, with quartz averaging less than \$2.25, coin, per ton, makes it pay 30 per cent. per annum on that capital! * * Truly we have much to learn from our Australian cousins, if they can do these things; and it is certainly incumbent upon the Government to send thither a competent person to ascertain the truth, and give us the advantage of his knowledge.—*American Journal of Mining*, N. Y.

If our New York cotemporary will peruse the last issue of the PRESS, he will observe that Californians can mine and mill similar rock to that of the Black Hill mine for less than \$1 per ton. There are scores of mills in this State crushing hard ores at a running expense of less than \$1.50 per ton.

[Editorial Correspondence.]

THIRTEENTH ANNUAL STATE FAIR.

THE THREE FIRST DAYS.

The Fair has now progressed through one-half of its allotted time, and notwithstanding exhibitors have been slow in coming forward with their articles, this Pavilion is now very well filled; nearly fifty entries were made yesterday—the third day of this exhibition. The city and its hotels are crowded with strangers, who are still continuing to arrive with every boat, train and stage. The San Francisco boat of this morning brought up a very full load. The weather has thus far been unusually favorable, and cheerfulness and vivacity everywhere prevail. The attendance at the Pavilion is increasing with each day's continuance of the Fair. The attendance, last evening, on the occasion of the Annual Address, was very large. Hundreds were in waiting outside before the doors were opened. The Hall was crowded, so much so that independent locomotion was rendered almost an impossibility—the only convenient progress being with the crowd, as it circulated about the hall in one dense mass of moving humanity. It is said to have been the largest attendance ever witnessed in this city, on any similar occasion. All the fashion and beauty of the metropolis were there, and as the mass swept slowly around the avenues, those who desired to listen to the address, gradually drew out from the moving crowd, and filled the chairs which were arranged in the vacant spaces about the speaker's stand.

A little before nine o'clock, the President of the Society, Chas. F. Reed, Esq., with the other officers and their invited guest, Dr. D. J. Macgowan, with the orator of the evening, filed slowly through the crowd until they reached the speaker's stand, when the President, with a few brief words, introduced to the audience Joseph W. Winans, Esq., of San Francisco, who delivered the regular Annual Address. The address was happily conceived, eloquently delivered, and received with most marked and earnest attention. It appears in full in the *Union* of this morning, and will doubtless be published in the *Bulletin*. It should be read by every Californian, and distributed far and wide among our friends at the East, as a truthful and eloquent exposition of the resources of our State, and the indomitable energy and enterprise of her population.

THE DISPLAY AT THE PAVILION.

As we have already intimated, is quite large and varied. The products of the soil, the mine, the forest, the orchard and the vineyard, are here in great profusion. Our manufacturers are represented in their abundance and variety, and almost everything which toil contributes within the limits of our State, to the development and progress of the human race, appears to have a representative here. While, however, nearly every department of industry is represented to some extent, it is very much to be regretted that such exhibition is not more full and varied in the different classes. The exhibition, as it is, furnishes the most abundant evidence, that with a little more effort on this part of those most interested, it might easily have been made vastly more extensive and attractive. True, space under present arrangements might in such an exigency have been scarce; but we presume the management would have been abundantly able to have provided for any possible contingency that might have occurred.

THE DISPLAY OF FRUIT

Is the most prominent feature, and is unusually large and varied, attracting much attention. Some idea of this display may be inferred from the fact that one individual, J. R. Nickerson, of Lincoln, exhibits 265 varieties of apples alone, in addition to 92 varieties of pears, 30 of peaches, 12 of quinces, 240 of grapes, besides figs, plums, dried fruit, raisins, preserves, etc. There are also seventeen other exhibitors of fruit, and ten of native wines.

THE MINERAL EXHIBITION.

The display of minerals, so far as it goes, is very interesting; but it is much short of what

it should have been. The chief cabinet minerals are contributed by Dr. J. M. Frey, of Sacramento, who furnishes thirty-six beautiful specimens. J. Johnson, Jr., also of Sacramento, furnishes a very fine case of cabinet minerals.

Professor W. P. Blake, of San Francisco, furnishes a very neat display of sixteen specimens of crude and refined petroleum, from different localities in California. Harkness & Co. exhibit massive specimens of silver ore from Blind Springs, Mono county, California. These masses weigh in the aggregate four hundred pounds, and contain over \$1,000 of silver to the ton, and twenty-five per cent. of copper. They form part of a shipment of three tons and a half which have just been sent to Swansea for reduction, to which place five previous shipments have been made. These specimens will be sent to the Universal Exhibition at Paris next year. The course of the vein whence they are taken is a little west of north and the mine lying directly south of Aurora, the course of the vein would be a little east of Virginia City, Nevada. This mineral exhibition, limited as it is, appears to form one of the most attractive features of the exhibition.

MINING MACHINERY.

Mining machinery, which should have occupied a large space in the lower hall, is confined to the single exhibition of one of Crall's Waltzing Amalgamating Pans, combined with a grinder, entered by the Vulcan Foundry of San Francisco. The grinding of this pan is effected by a series of four or more grinders revolving around a common center, and at the same time upon their own axes, and hence called a sun and planet motion. This double action appears to break up the rotary motion, which the pulp invariably receives in all other pans, more than in any other in use. It must also possess the additional advantage of constantly presenting new grinding surfaces to every part of both shoes and dies, thus avoiding the striated effect, in wearing upon pans which have a uniform revolving action constantly repeated over the same surfaces. We understand that this pan has been for some time in successful operation in San Juan, and one or two other places in Nevada county. The pan now on exhibition is destined for a mill near Nevada, and the inventor also has an order for the introduction of his principle into twenty pans of other construction, now at work in a mill in Amador county. The revolving mullers can be easily substituted in any of the flat-bottom pans in use, and at a small cost. A patent for this invention was recently obtained through the MINING AND SCIENTIFIC PRESS PATENT AGENCY.

AGRICULTURAL MACHINERY.

The display of agricultural machinery is quite full; but consists mostly of those of Eastern manufacture. Out of the great number of agricultural inventions we notice only Mott's Double Reversible Plow, Hill's Improved Seed Sower, Hattabough's Hay Fork, exhibited in model only, a Grapa Crusher and Press combined, and two of Robinson's patent Fruit Gatherers. Instead of this meager display of home ingenuity, the lower hall should have been entirely filled with California inventions, to the exclusion, if need be, of all imported ones. We have no time in the present issue to notice the above, and one or two other Eastern inventions on exhibition. We shall endeavor to do so next week.

There will be a grand trial of agricultural implements across the river to-morrow, at which your correspondent will be present.

OTHER NOTABLE EXHIBITS.

Among the other notable exhibits on exhibition, we have barely room to mention to-day the superb specimens of silkworms by L. Prevost, of San Jose; samples of cotton manufacture, sheeting and twine, from W. H. Rector of the Oakland mills, etc.

STEAM AS MANUAL LABOR.—At a late fire in London, it is said that the steam fire-engine, did as much work at a cost of about \$60, as would have cost \$7,000 by the old system of manual labor.

HEAT PRODUCED BY THE AGITATION OF WATER.

While engaged in experimenting on the evolution of heat by the agitation of water, Mr. Rennie made use of a kind of churn capable of containing ten pounds of water, and which revolved at the rate of 232 revolutions per minute. He succeeded in raising the temperature of the water to a boiling point, and, as an illustration, an egg was boiled hard in ten minutes. A large portion of the heat generated in the Freiberg barrels may probably be accounted for in this manner. *Mining and Scientific Press.*

We are at a loss to see wherein heat can be generated by the simple agitation of water. Does it arise from friction of the water upon itself, or upon the sides of the agitating vessel; or is it caused by compression of the water? We do not know what Mr. Rennie's theory is; but it appears to us that the heat cannot be evolved by compression, for water is nearly incompressible. Friction causes the latent heat of one or both media to become sensible, according to the old theory. * * * *N. Y. Gas Light Journal.*

Whenever friction is overcome, heat is the result; and the heat thus produced is the exact measure of the force expended in overcoming the friction. Does our cotemporary doubt that there is friction between particles of water when in agitation? Professor Tyndall, in his lecture delivered January 23, 1862, says, in effect, that the water at the foot of a cataract is warmer than that on the top. The increased heat is produced by the friction between the particles of water being overcome in their clash at the bottom of the fall. The same authority, and there is no higher, admits the correctness of the theory that the sea is rendered warmer during a storm, by the mechanical dash of its billows, the one upon the other, being ultimately converted into heat.

Numerous experiments have been made with water, oil and quicksilver, by Mr. Joule, of Manchester, and others, to prove the evolution of heat by the agitation of liquids. These experiments were mostly made by placing the liquids in a suitable vessel and agitating them by paddles. These paddles have been driven by a measurable force, and the amount of heat, as carefully ascertained, has been found to be exactly equivalent to the force applied. Water has also been forced through capillary tubes, and the amount of heat generated by the friction of the liquid against the walls of the tubes found to bear the exact relation due to the force employed.

A given amount of force employed in causing two disks of iron to be rubbed against each other produces as much heat as when the same force is applied in agitating water, oil or quicksilver. Of course the temperatures of the different bodies would vary according to their respective capacities for heat. Water, for instance, would be only one-thirtieth of the temperature of mercury; but the absolute amount of heat generated, by the same expenditure of power, is in all cases the same. Sir Humphrey Davy produced heat by rubbing together two pieces of ice.

By employing a thermo-electric pile, in connection with a carefully constructed galvanometer, the heat generated in pouring water or quicksilver from one glass or cup to another, for eight or ten times consecutively, may be readily observed and accurately measured. To render such an experiment reliable, the glass or cup should, of course, be carefully swathed around with listing or some similar non-conducting substance, which would prevent any warmth being communicated to the glass by the hand.

In the above experiments we have no measure of the absolute amount of heat communicated to the liquids; but we may safely infer from what has been said, that Mr. Rennie could have had no difficulty in boiling an egg, or any number of eggs, in water heated by agitation.

THE DRAIN OF GOLD TO EUROPE.—In London the complaint is, that although large amounts of gold come into England from America and Australia, none of it stays there, but all goes to Paris. The latter city attracts the precious metals from all portions of the globe, and all nations seem at present to be her debtors.

NEW PATENTS AND INVENTIONS.

Under this heading we shall mention, from week to week, as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to Inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

DUMPING-CAR.—James Braidwood, Wilmington, Ill.: I claim the frame, c, constructed substantially as herein recited, in connection with a rail track, and for the dumping of the cars, all constructed and operated as described.

APPARATUS FOR TREATING ORES WITH CHLORINE.—Eugene Gaussoin, Baltimore, Md.: I claim, 1st, The inclosing walls and floor, forming chambers in which the barrels revolve, and from which the fluid contents are removed by drains from the sides and the solid by an aperture at the corner of the arch. 2d, The combination of hollow axes and perforated walls, forming a series of connections from the generator, from barrel to barrel, and ultimately to the discharge apertures at the summit. 3d, The arrangement of the barrels with their operating gearing, so that their respective openings are in revolution presented alternately to the openings of the ones next in series above, and next below, to afford the means of discharging, as described. 4th, The combination of the revolving barrels and the openings, J, and wall openings, H, as and for the purpose described. 5th, The combination of the valve, K, with the drains, Y, W, as and for the purpose described.

REVERBERATING AND OTHER DRAUGHT FURNACES.—John R. Groat, Detroit, Mich.: I claim, 1st, In a reverberating or other draught furnace, so arranging the atmospheric passage ways, a, a, and b, b, in the bridge wall and arch of the furnace, that the air passing in thin currents, shall be heated by contact with the walls, and introduced from above and below into the compartment, D, in converging currents of the full width of the throat, C, when mingling with the unconsumed, carbonized gases evolved from the fuel in the fire-room, B, their complete combustion and perfect diffusion will be effected, substantially in the manner set forth. 2d, The combination of the plate, f, valve, g, rod, h, and lever, i, in the lower air passage and the similar combination in the upper air passage, or their equivalents for the regulation of the passage of air through the atmospheric passage ways, a and b, substantially as and for the purposes set forth. 3d, Constructing the bridge, C, across the lower atmospheric passage way for the protection of the valve, substantially as set forth.

FORCE PUMP.—E. B. Harris, Wilmington, Ill.: I claim the arrangement of the well, A, cylinders, C, C, valves, D, D, vertical rods, E, E, disks, F, F, valves, G, G, partitions, H, H, valves, I, I, and trough, J, operating in the manner and for the purpose herein specified.

METHOD OF GRANULATING FURNACE SLAG.—Chas. E. Morris and John Eynon, Bridgeport, Pa.: We claim granulating furnace slag by running it in its hot fluid condition from the furnace, directly into any suitable receiver containing cold water, substantially in the manner described.

COLLAR FOR DRILL RODS.—V. T. Priest, Decatur, Ill.: I claim, 1st, The combination of the rods section, A, and grooved section, A, connected by a screw-joint, with the inclined or mitered key, I, and key-seat, C, the adjustable band, F, and groove, H, substantially as described. I also claim the grooves, D, and recesses, E, in the upper section or rod, A, in combination with the band, F, having internal pins, G, substantially as described.

METHOD OF PACKING NITROLEUM, NITROGLYCERINE, ETC.—Taliaferro P. Shafner, Louisville, Ky.: I claim, 1st, The placing between a bottle containing nitrooleum, nitro-glycerine, or other liquid combustible compound and an outer casing or box, india-rubber (or caoutchouc) or other material, to serve as springs for the purpose of lessening concussion upon the said liquid substance by an exterior force resulting from a fall or otherwise, substantially as hereinbefore described. 2d, The application of plaster-paris powder, or of other equivalent non-conductor of heat and non-explosive or combustible substance, when saturated with the liquids hereinbefore mentioned, in combination with the arrangements or parts substantially as hereinbefore described. 3d, The use of metallic bottles for the purpose of confining the nitrooleum, nitro-glycerine, or other explosive liquid, in combination with the arrangements and parts, substantially as hereinbefore described.

DRIVING WELL-TUBES.—Calvin Shephard, Kattleville, N. Y.: I claim, 1st, The combination of the tube, A, constructed as described with the flange, F, the collar, E, and platform, D, suspended therefrom, all arranged and operating in the manner and for the purpose herein specified and shown. 2d, I also claim the platform, D, supported on the flange, F, as shown in combination with the well-tube, substantially as described.

GOLD SEPARATOR.—Charles F. Testman, Portland, Oregon: I claim three things, the first is the process of drying dirt in the boxes, a, a, and b, b, by means of the fire, e, the second is the application of the springs, o, o, to the roller, m, and the third is the method of constructing the amalgamating pans, r, r, and procuring thereof the gold dust in the quicksilver pockets by means of the continued revolutions of the stirrer, q, q.

PUMP.—Daniel M. Thomas, Dowagiac, Michigan: I claim, 1st, The arrangement of the plunger chamber, B, so as to communicate with the induction chamber, E, at its upper end, and the side passage, D, which leads to the receiving chamber, G, substantially as described. 2d, In combination with a force pump, which is constructed with upper and lower inlet chambers, leading to the main piston chambers, I claim the application of a safety-valve, h, to the vertical discharge pipe, H, substantially as described. 3d, The vibrating frame, C, connected to the working beam, L, by means of flexible connections, l, l, in combination with the eegments, J, J, and pendulum, J2 for operating the pump pistons, substantially as described.

PUMP.—Joseph Douglass, assignor to W. & B. Douglass, Middletown, Conn.: I claim the combination of the diaphragm, D, hollow piston-rod, B, having a perforated enlargement, B, and piston, G, as described, valve, H, with its shindle, d, and guide-fingers, c, cylinder, L, and side-pipe, I, provided with valves, J and J, all arranged and operating substantially as described for the purpose specified.

PATENTS can be obtained for citizens on this Coast, through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. In one half the time it takes to operate through Eastern agents. From our familiarity with the subject of most California Inventions, and the benefit arising from personal explanations, we are prepared to present claims with greater accuracy than could reasonably be expected of distant agents. DEWEY & CO., Patent Agents, 505 Clay street, San Francisco.

MINING AND SCIENTIFIC PRESS.—The paper whose name we have just written, ranks among the leading scientific journals of the world. On mining matters it certainly has no equal, and more than all other causes combined, it has advanced the interests of the quartz miners of the Pacific Coast. Its editors are men of thorough education and large practical experience, and its list of contributors embraces many names distinguished in the various fields of scientific exploration and mechanical invention. The MINING AND SCIENTIFIC PRESS ought to circulate universally among intelligent Californians, to whom we most cordially commend it, and its traveling agent, O. P. Truesdell, who is now canvassing this city and county, and will shortly visit other counties in the southern part of the State, in its interest. [Stockton Daily Independent, Sept., 1866.]

STRANGERS visiting San Francisco can use the Burglar Proof Vault of the CALIFORNIA BUILDING, LOAN AND SAVINGS BANK, California street (one door from Sansome street), for the temporary deposit of Gold Dust, Coin, Bonds, etc., at a small monthly rent, according to the value of the property deposited, for which the Company will be accountable. 9v12-1m THOMAS MOONEY, President.

[ADVERTISEMENT.]

FIFTH ANNUAL REPORT

Of the Directors of the California Building, Loan and Savings Bank, to the Shareholders, assembled September 10, 1866.

The shareholders, before proceeding to the election of nine Directors for the ensuing year, naturally desire, and are entitled to, an account of the management and affairs of the Society for the year that is passed.

The present Board of Directors undertook their duties a year ago under influences of great peril. The assets of the Society on our taking office were \$250,225 25. The assets in our hands to-day are \$300,000—thus doubling our means of public accommodation in one year. The profits realized for the six months ending the 30th April, are as follows:

DR.		
Interest received on mortgages.....	\$10,802 79	
Premiums received on mortgages.....	6,623 91	
Interest received on loans on stock.....	864 8d	
Profits on casual interest.....	632 00	
		\$27,923 50

CR.		
Interest due to depositors.....	\$8,280 44	
Interest paid to depositors.....	4,616 45	
Div. on stock, cash, 1½ per cent.....	4,025 28	
Expenses of management.....	5,200 00	\$22,122 25

Showing a clear surplus of full five thousand dollars, after paying 1 per cent. per month to all depositors; one and one-half per cent. per month to all the stockholders; beside paying expenses of management and all other incidental charges. This surplus, added to the reserve fund previously accumulated, and the paid up capital, makes a total of full fifty-six thousand dollars of reserve, to protect us against unforeseen losses or casualties in the prosecution of our business.

As yet the Society has incurred no loss from its loans. The number accommodated with loans for the past year, was 310.

The loans made now average forty to fifty thousand dollars a month. The past month they reached sixty seven thousand dollars, which is double the average amount made by the Society a year ago.

THE NEW BANKING HOUSE.

The Board have the pleasure to report (under instruction from the last annual meeting) the purchase and outfit of the new Bank premises, which stands the Society in \$48,000. The location selected, and the fittings of our new Banking House have won the approbation and confidence of the community. The income in rent from the upper part amounts to about a \$140 per month; the income from the vault and cellar for storing valuables amounts to about \$50 per month, leaving a liability on the business of the Society of about \$300 a month in lieu of rent. It has been remarked, and is remarkable, that since our Directors have bought and opened our new Bank, many other wealthy and influential money institutions have purchased on the same scale of us at considerably advanced rates, and are now causing to be erected large and elegant buildings, which undoubtedly adds to the value of ours; in fact, the block in California street in which we located our Bank, is evidently destined to become the "Money Market" of San Francisco. In connection with this topic, our Society, by the liberality of its aid in assisting parties to build, has stirred the industry and enterprise of the city, there being no scarcely a mechanic connected with the building trade idle.

THE DIRECTORS.

The Directors meet regularly in the Bank as often as they are notified. All applications for loans are considered by them, none are made which are not unanimously voted. There are duplicate cash books kept in the office. Every item of receipts or payments are twice entered—once by the Cashier in his book, and once by the Book-keeper in his. The two books are brought together at the close of the day's business, when each item is called over in presence of the President. If any mistake has occurred during the day, it is at once discovered by the footings of the books and the counting of the cash on hand. The books must therefore balance and agree every day at the close of business. The cash is then locked up in the vault by the President, and every morning is handed out again to the Cashier, who counts it before opening the Bank.

The Reserve Funds of the Society are invested in City of San Francisco Bonds, which, to the amount of fifty thousand dollars, are placed under the inner safe. The inner safe has three separate locks. A key to each is held, one by the President, one by Mr. Crim, the Secretary, and one by Mr. McCormick, member of the Finance Committee. The Directors have made every proper effort to increase and facilitate business. The recent extension of loans on manufactures and merchandise, has been attended with the best results.

PRESIDENT'S SALARY.

In view of the increased trust, duties and responsibilities of the President in the opening of the new bank, and the great expansion of business which arises, the Board of Directors, on the 3d of May, voted an increase of salary from \$150 to \$250 a month, subject to the approving vote of the present meeting. No other Director receives any salary.

INSURANCE.

The President reports that our Society, since it came into operation, paid out to various Insurance Companies \$11,000 as premiums on insurance of our various houses which are scattered through the city and suburbs, and that only \$1,000 were lost by fires on their houses during all that time, thus leaving a profit of \$9,000, which has gone over to the benefit of the members outside the members of the Society. And he recommends that the members of our Society form within themselves an Insurance Company, under the laws of the State, and in our own building, which, under prudent management, must, at no distant day, become a powerful appendage and profit to our Society. Respectfully submitted,

THOMAS MOONEY, President.

SAMUEL CRIM, Secretary.

PHOTOGRAPHS

MADE BY

MESSRS. CHALMERS & WOLFE,

611 Clay street, San Francisco,

Are the best made in the city. An examination of their specimens before you will show, will prove the truth of the above assertion. Prices—the lowest adopted by the Association of Artists. Remember the place, 611 Clay street. 11v13-4m

A VERY EXTRAORDINARY FIREARM is being exhibited in England, which, its English admirers claim, must entirely supersede Colt's revolvers, Spencer's seven-shooters, the needle rifle, the Enfield, or any other old or new invention. The principle of it is that in place of the chambers or the revolver attached to the pistol or rifle, the arm is, as it were, a skeleton pistol, having a barrel, stock and hammer. The cartridges are inserted in a separate horizontal elongated steel receptacle. When it is desired to load the pistol this thin elongated box containing the cartridges in separate cells, is inserted in the empty space left for it between the barrel and stock, and then, as fast as the finger can draw the trigger, it passes through of itself, until all the cartridges are fired. Another can then be inserted, and the firing continued at almost any rapidity, and for as long a period as there are receptacles of cartridges. A rifle could in this manner fire sixty shots a minute. A child could be reloading the empty cartridge cells with perfect safety. The principle is also applicable to big guns. The inventor is Mr. James Gale, the blind gentleman who invented the system of making powder non-explosive.

The *Scientific American* says that the idea is not new; as a Mr. Kellogg applied the principle several years ago to a rifle barrel mounted on a carriage. Possibly Mr. Kellogg might not have put the idea into so practical a shape as Mr. Gale has done, and hence the fact that it never came into general use.

A NARROW ESCAPE.—A boy of ten years, named Wm. Cain, fell into the weigh lock of the canal at Waterford, N. Y., at the moment it was being exhausted preparatory to weighing a boat, and was drawn in an instant down through the heavy timbers of the scales, and shot out with lightning-like rapidity by the rushing current, passing under the canal bank through a tunnel about one hundred feet long, and then over a fall of ten feet into the open stream. The bystanders had gathered on the bank, expecting to see his lifeless body crushed and floating down toward the Hudson, when he suddenly emerged and crawled up the wall unhurt.

Machinists and Foundries.

LEWIS COFFEY & RISDON,
Steam Boiler & Sheet Iron Works.

THE only exclusively Boiler Making establishment on the Pacific Coast owned and conducted by Practical Boiler Makers. All orders for New Work and the repairing of Old Work, executed as ordered, and warranted as to quality. Old Stand, corner of Bush and Market streets, opposite Oriental Hotel, San Francisco.

THE MINING PRESS comes loaded with a rich variety of mining intelligence, and all sorts of scientific interesting matter.—[Amador Ledger.]

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic Hay, Rag Screw and Drop Presses, Coining Machinery, File Drivers, Bark and Malt Mills, and all kinds of Castings.
ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable, Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.
ROLLERS.—Locomotive, F. & C. Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.
PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tub, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.
Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

Excelsior Mine, Meadow Lake District, Nevada County.

We have been furnished with the following particulars of the above named mine, which is located in one of the most remarkable quartz districts in this State:

The Excelsior Mine was located in 1863, by H. Hartley and others, and comprises a claim of 4,000 feet, or shores. The company is incorporated as the Excelsior Consolidated Mining Company, and has two ledges with 2,000 feet on each, named the Union Ledge, No. 1, and Union Ledge, No. 2. The vein rock shows free gold at every point on the company's claim. A tunnel has been run into the No. 1 ledge, in which, at the depth of eighty-five or ninety feet from the surface, the vein seems to be divided, and the front vein has been cut, showing itself thirteen feet thick, carrying free gold, with a large amount of gold-bearing sulphurets. The tunnel is now being pushed ahead to cut the back strata, present indications showing it to be near at hand. A large force of men is also sinking upon the vein, from the surface, getting out ore for the company's new mill of twenty stamps, which will be ready to go into operation about the 5th of September. The ore from this part of the vein is very rich in free gold and sulphurets and resembles very much the Star Spangled Banner rock, of Nevada.

The mill of twenty stamps, 950 pounds each, is being built by Capt. I. S. Harrison, of San Francisco, for one-half of the mine, and is a most substantial piece of workmanship. It is founded upon the solid rock, and is being constructed under the superintendence of Mr. Peter Taylor, formerly of Virginia City, for a portion of the mine and mill. It reflects great credit on Mr. Taylor as an architect. The engine has the capacity of sixty-five horse power, and is supplied with steam from two splendid tubular boilers. The boilers are being set in the most substantial manner, in solid masonry lined with brick. The process of working will be by amalgamating in the batteries, then twenty feet of copper plates in front of batteries. The ore will then be deposited in immense tanks, one for each battery of four stamps. At the bottom of these are small apertures, which can be opened or closed at pleasure, to draw off the sand or sulphurets into small sluices, to live of Mosheim's concentrators. In order to obtain a regular supply, Mr. Taylor has introduced a novel idea of "drawing off." He runs a two-inch pipe over the top of the tanks filled with water; from thence he branches off with one-half inch pipes, furnished with stopcocks; these half-inch pipes lead to the aperture at the bottom of each tank, thus cutting the base from the mass of sand and sulphurets in the tank, and causing it to drop into the sluices and on to the concentrators, giving them the most regular supply needed. If more sand is wanted, more water may be turned on—it works effectually.

After the ore is concentrated, then it is ground into a pulp by means of a row of Eureka grinders, which revolve at the rate of 148 revolutions per minute. After being well ground, it passes from thence into a row of Knox's pans, for amalgamation.

The mill is built on a side-hill, with plenty of fall to carry the ore from one place to another without handling. The mill is supplied with one of Brodie's No. 2 quartz crushers. The mill house is a most substantial structure, being sixty-two feet long by thirty-two wide, with eighteen feet posts. The boiler and engine house is forty-two by twenty-six feet, and ten feet posts. Everything has been done to make it one of the most perfect mills in the county of Nevada, and from the appearance of the mine it cannot fail to prove an immense success. Capt. I. S. Harrison is superintendent of the mine and mill; Martio White, Esq., of Virginia City, is president of the company for the ensuing year.

WEBSTER AT BUNKER HILL.—The following anecdote is "going the rounds of the press." We don't know whether it is authentic or not—though it is not to be found in any copy of the Life of Webster; at any rate it is a good story:

When Daniel Webster was delivering his memorable speech at the dedication of Bunker Hill Monument, the crowd pressed forward to such an extent that some were fainting and some crushed. Officers strove in vain to make the crowd stand back. They said it could not be done. Some one asked Mr. Webster to make an appeal to them. The great orator came forward, stretched forth his hand, and said in a deep, stentorian tone, "Gentlemen, stand back." "It cannot be done!" they shouted. "Gentlemen, stand back," said he, without a change of voice. "It is impossible, Mr. Webster, impossible." "Impossible?" repeated Mr. Webster, "impossible? Nothing is impossible on Bunker Hill!" and the vast crowd swayed, and rolled back like a mighty ocean wave.

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern. Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call special attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

GODDARD & COMPANY.

International Hotel,

Southwest corner of Davis, up-stairs. 2v12

Capitalists, Attention!
QUARTZ MILL & MINING PROPERTY
FOR SALE
In Nevada County.

A NEW 8-STAMP QUARTZ MILL, 7 LEDGES AND 610 acres heavily-timbered Land, near Eureka, Nevada County, are now offered for sale. The Mill is run by steam power, and is in complete order for business. The ledges, which form the principal value of this property, are all large and well-defined, but require a further outlay of capital, in order to make them remunerative. For the lack of means to properly develop these claims, the present owners are disposed to sell the same for a reasonable price. Capitalists wishing to engage in mining will find this a splendid opportunity to purchase a property that will bear rich scrutiny, and offers superior inducements as an investment.

For address and further information, inquire of The Publishers of the MINING AND SCIENTIFIC PRESS, 505 Clay street, San Francisco. 22v12

NOTE.—We would specially call the attention of MILL owners and Engineers to our superior PARAFFINE OIL, which we manufacture from the California Petroleum. This Oil will not gum. Machinery thoroughly cleaned and lubricated with it will not heat, and after remaining at rest, can be started without cleaning out.

A sample can of our Paraffine Oil will be forwarded on application to us, as we desire a fair and impartial trial.

Lamps and Lamp Stock!
An elegant and complete assortment on hand. 8v12-3m 414 Front street, San Francisco.

THE CALIFORNIA
Aerated or Unfermented
BREAD COMPANY.
Bakery on Folsom Street,
Between Tenth and Eleventh.....SAN FRANCISCO

MESSRS. TAGGART, BULKLEY & DUFF, HAVING ASSOCIATED themselves in partnership, are happy in announcing to the public that they are now prepared, and would respectfully solicit all orders for his truly wholesome and cleanly Bread. We have a sufficient number of delivery wagons, at our bakery to guarantee to all who may favor us with their patronage a prompt delivery of fresh bread daily, Sundays excepted.

Through the kindness of the gentlemen of the following named firms, we are privileged to keep an order box for the entry of all orders for the bakery so that they may reach our earliest attention:

Order box at C. J. Hawley & Co.'s Grocery, corner Second and Jessie streets; Rowland & Walker, 67 Clay street; Plum's Carpet Store, Montgomery street, opposite Lick House; G. W. Clark, Paper Hanging, corner Sansome and Clay streets. Orders handed to any of the route-men likewise. We expect soon to be prepared to supply Pastry, likewise the Boston Brown Bread, and Beans of the first quality. Due notice will be given.

The present Company is entirely independent of the former California Aerated Bread Company, neither of them having been in any way connected with that company. We would cordially invite the public to make a visit to our new bakery. 4v13-3m S. R. BULKLEY, Business Partner.

METALLURGICAL WORKS,
—AND—
Practical Mining School,

Bryant Street, between Third and Fourth,
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphurets, pyrites, and the so-called "reluctant ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, reducing by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.
The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining, and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

dental Lode, San Benito Mining District, County of Mon-

terey, State of California.

Notice is hereby given, that at a meeting of the Board of

Trustees of said Company, held on the twenty-third day

of August, 1886, an assessment of one dollar (\$

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Framework; E, Screws; G, Lever; H, Dash-Boards; I, Key; a, Dies; c, Shoes, and o, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan when properly constructed, are respectively 177, 118 and 132.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes direct from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the
PACIFIC FOUNDRY,
141
San Francisco.

LEFFEL'S American Double Turbine

THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given unusual satisfaction whenever used, is now for sale by KNAPP & GRANT, 319 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 500 feet fall. Let us know how much water you have either in miner's inches or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to
KNAPP & GRANT,
— ALSO —
San Francisco.

Leffel's Lever Jacks,

For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks, for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind. For sale by
KNAPP & GRANT,
San Francisco.

PAGE'S PATENT FOR RAISING SUNKEN VESSELS!

SHIPPING AND INSURANCE COMPANIES, AND other parties upon this Coast or in the Atlantic States, having occasion to avail themselves of this invention, which has been tried and proven a success, will please address, for the present, JOSEPH DAVIN, Esq., San Francisco or at the office of the MINING AND SCIENTIFIC PRESS, 5413

AUSTIN Z. PAGE, Patentee.

Book Printing should be considered and treated as one of the higher branches of the "Art of Arts," and its execution entrusted only to experienced and intelligent workmen. Strict attention will be given to all orders for BOOK AND PAMPHLET PRINTING entrusted to the Mining and Scientific Press Job Office.

BAUX & GUIOD'S Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1884, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine Scientific Knowledge with Practical Experience, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgamators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jefferson Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Grail's Gravel Cement Works, Nevada county; Walman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Hough & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address
J. H. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 418-8d

It tells us truly the Minute, Hour, Day of the Week and Day of the Month.

HORTON'S PATENT CALENDAR CLOCK!

MANUFACTURED BY THE

ITHACA CALENDAR CLOCK COMPANY,

Ithaca, N. Y., and for sale by

W. J. EGBERT, Agent,

At Job M. SEAMAN & Co's, 631 WASHINGTON STREET, San Francisco.

THIS TIME PIECE costs but a trifle more than any other good clock, and is just the article for every well-regulated business house, office, saloon, or, in fact, any place where a handsome, perfect time-keeper is duly appreciated. The Clock has two dials, the first being the same as an ordinary clock; the second has but one pointer, and shows the day of the week, the month and day of the month. It is arranged to mark the days in leap years with equal regularity. It has an eight-day piece, and runs from year to year without change. It can be examined at the Office of the MINING AND SCIENTIFIC PRESS. 21316-tf

To Ditchmen, Millmen and Others Requiring IRON PIPE.

M. R. ROSE, CORNER OF 9TH AND K STREETS, Sacramento City, has facilities unsurpassed on this coast for the manufacture of IRON PIPE of every description. He also has on hand a deep well FORCE PUMP, of his own invention and manufacture, well adapted for oil wells. His tools being portable, pipe can be manufactured on the ground. 1912

EXCELSIOR PUMP!

HOOKER'S PATENT!

CHALLENGES COMPETITION!

THIS DOUBLE-ACTING SUCTION AND FORCE PUMP CHALLENGES COMPETITION, for simplicity, durability and power, and will work at any depth. The pistons for Mining Pumps are packed with hemp. The valves are reached by simply removing the "bonnets," thereby avoiding the trouble of raising a long column of pipe. They will raise as much water as TWICE their size of single-acting Mining Pumps, and are sold at half the price. We have never heard of the valves in this Pump being out of order. For their many superior points they are fast replacing all other Force Pumps. Reference can be given where this Pump is working with eighteen others of different patterns, and is pronounced THE BEST; also, from some of the best miners in the State who have them in use. For manufactories, farms or domestic use, we warrant them the best and cheapest. All sizes adapted to any power or any purpose. For sale by agents throughout the State.

J. W. BRITTAN & CO.,

General Agents,
120 Front street, San Francisco. 21313-3m

Send for Price List.

STODDARD'S CELEBRATED WATER FILTERS!

RENDER RAIN, RIVER, OR SPRING VALLEY WATER perfectly pure and healthy. Three sizes. Price, \$12, \$15 and \$18. For sale by

S. B. STODDARD,
Corner of Battery and Pacific streets.
June 23, 1886. 25112-3m

Union Amalgamator.

This Valuable Invention

IS FAST FINDING ITS WAY INTO GENERAL USE, NOT by means of combination of capital and influence, but on the strength of its own merits, and upon the principle that what is known to be good will be appreciated. Practical men acknowledge the UNION PAN to be scientific, the best, the cheapest, and most profitable. It now stands first on the list of all pans in use for the purpose of

Working Gold and Silver Ores.

It has been found that a low class of ores, also tailings from Mills, Sulphurates, etc., that will not pay to work with the common pans, may be worked with this and obtain large profits. The UNION PAN is manufactured in two sizes, capable of operating upon large quantities of ore in the most efficient manner.

Parties interested in Quartz Mining, Mills, etc., will find it to their advantage to call and examine for themselves, and see its operation. Gold and silver ores tested by regular mill process, at moderate cost, by

STRONG & CO.,

San Francisco Foundry, Corner Mission and Fremont streets, where orders will receive prompt attention. 15112-3m

BRUCKNER'S

Mechanical Roasting Furnace

AWARDED A

PREMIUM SILVER MEDAL

—BY THE—

The Mechanics' Institute.

THESE FURNACES ARE NOW MANUFACTURED AFTER an improved mode of construction, which GREATLY SIMPLIFIES THEIR OPERATION, and afford a much larger oxidizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

THE IMPROVED FURNACE

May be seen in operation, for desulphurizing or roasting and chloridizing, at Central Mill, Virginia City, Nevada.

Parties wishing to erect such Furnaces, are requested to leave their orders with

Purchase & Shipping of Machinery OF ALL KINDS.

Especially attention given to Quartz Mill Machinery and Findings, and Miners' Material of every description.

Being a PRACTICAL MACHINIST, and giving my personal attention to the execution of orders, I can guarantee the BEST class of work at all reasonable rates in the city.

Refer, by permission, to—
Governor F. P. Low; C. T. Menden, Stockton; Jacob Underhill & Co., San Francisco; J. W. Slove, Russell & Erwin Manufacturing Company, Office, No. 120 Front street, San Francisco. 4112

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most economical mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

Remarkable Cholera Cures.

Although the excitement with regard to the appearance of the cholera on this coast, has now pretty much died away, the following paragraph, with regard to some recent discoveries respecting its mode of treatment, will doubtless be read with considerable interest:

FIVE HUNDRED AND NINETY CASES TREATED—NO DEATHS.

All the medical cholera schools use camphor in their treatment of cholera, and its value has been admitted on all sides, yet it has always failed to effect the desired cure, unless the experience of Dr. Rubini should prove an exception. The "saturated spirits of camphor" used by this eminent Neapolitan physician consists, as we learn from a correspondent of *The London Star*, of equal parts, by weight, of camphor and spirits, and to the power thus obtained he attributes his success in the treatment of the disease. The ordinary spirits of camphor consists of one part by weight of camphor to nine parts of spirits of wine, while the homeopathic preparation is made by mixing one of camphor to five of the spirits of wine. The quantity of camphor which water will take up is small, and to obtain the "saturated spirits of camphor of Rubini," it is necessary to distill spirits of wine, and get rid of so much of its water as will bring it to 60 degrees overproof, in which condition it will dissolve and hold in solution its own weight of camphor.

With this "saturated spirits of camphor" Dr. Rubini treated in Naples 592 cases of Asiatic cholera without the loss of a single patient. Of these 592 cases 200 were cured in the Royal Alms-house, 11 in the Royal Poor-house, and 166 in the 3d Swiss Regiment of Wolff. That the 377 cases treated by Dr. Rubini in these public institutions were all genuine cases of Asiatic cholera, and some "terribly severe," and that all recovered, the evidence of the following distinguished individuals, with their official seals attached, sufficiently attests: Il Generale Governatore Ricci; Il Maggiore Commandante Nicola Forui; Il Capitano Commandante Carlo Sodero; Generale Commandante Fileppo Rucci, Colonel Eduardo Wolff.

The method of cure is as follows: "When a man is seized by cholera he should at once," says Rubini, "lie down, be well wrapped in blankets, and take every five minutes four drops of the saturated tincture of camphor. In very severe cases the dose ought to be increased to from 5 to 20 drops every five minutes. In the case of a man of advanced age accustomed to take wine and spirits, where the drug given in drops has no effect, give a small coffee spoonful every five minutes, and in a very short time the coveted reaction will occur. Ordinarily, in two, three or four hours, abundant perspiration will come out, and then cure will follow." "The preventive method," writes Dr. Rubini, "is this: Let those who are in good health, while living in accordance with their usual habits, take every day five drops of the saturated spirits of camphor upon a small lump of sugar (water must never be used as a medium, or the camphor will become solid and its curative properties cease), and repeat the dose three or four times a day. Spices, aromatics, herbs, coffee, tea and spirituous liquors should be avoided."

Here, then, we have as strong a *prima facie* case made out as can well be conceived in favor of the preventibility and curability of the Asiatic cholera, and that by a remedy which is at once portable and inexpensive, and which all sections of the medical profession have heretofore employed, and can, therefore, raise no objection to employing again in increased potency.

J. B. CONE, BUSINESS AGENCY.—Makes private sales of Property and Business Places of every description, in the city and throughout the State; procures partners with large and small amounts of money; negotiates sales of mining property, and does a General Agency Business. Patronage solicited by mail, express, or by personal application at the office, 402 Montgomery Street, San Francisco, California. 23v111

Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

HOADLEY'S.

FOUR SIZES,

8, 10, 12, and 15-Horse Power,

HOADLEY'S.

3 to 40-Horse Power.

HITTINGER'S.

THREE SIZES,

5, 7, and 10-Horse Power

HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, AND ECONOMY, with the Minimum of weight and price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes. Steam can be put up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with an without carriages.

Also, Portable Saw and Grist Mills.

For sale by
TREADWELL & CO.,
18v12 Corner of Front Market and streets.

A Hint to Advertisers in General, and San Franciscans in Particular.

The following article from the *Mountain Messenger*, published in Downieville, the county seat of thrifty Sierra, illustrates an important fact which some people are prone to overlook, viz: that it is not the lowest priced advertising which is the cheapest. For instance, an advertisement inserted for \$30 in a journal issuing 3,000 copies, is twice as cheap as \$20 in a paper having only 1,000 circulation:

Judicious Advertising.

It is passing strange how few business men in the cities of this State understand advertising judiciously in the country press, whether making their arrangements with the publishers or their agents in San Francisco. There are five different agencies which receive advertising for the country papers of the interior, only two or three of which are able to secure an agency for first-class papers, such as have an extensive circulation and established rates of advertising, from which they decline to vary at the option of the advertiser. These papers are usually full of advertising at fair rates, only a trifle in advance of papers having a very limited circulation. The other agents and publishers have no established prices, and consequently overcharge if they have an opportunity, but generally take advertising at about twenty per cent. less than usual rates; and the foolish advertiser who gets his advertisements into a score or two of these journals doubtless thinks he is advertising judiciously and cheaply, when in fact he is paying the very dearest price, considering the limited circulation his advertisement obtains. Thus, many business men, though they doubtless find it pays to advertise, even in this class of papers at this low rate, are advertising injudiciously and paying double rates for the circulation they desire to and might obtain by advertising in first class papers, the rates of which are but a trifle higher than those which advertise for such prices as they can obtain. These low price advertising agents work an injury to both publishers and advertisers, and are rarely able to liquidate when the quarterly settlement is due, and their names are bandied about through the press with epithets of well merited contempt.

While the penny-wise style of business referred to pays one class of advertisers very well, it works injury to others who fail to obtain the value of their money. There is hardly any kind of trade extensively carried on in San Francisco that will not pay to advertise throughout the State, to the mutual benefit of the advertiser and publisher; but a want of general information concerning the amount of trade to be expected has established a want of confidence to try. Advertising in the East is more general because statistics of trade and its profits prove its value, almost without trial. The inducements to advertise in this State are no less, as we propose to show by reference to the consumption of goods in this county.

From the Auditor's office we learn that there are no less than two hundred licensed retail dealers in Sierra county, whose annual sales in the aggregate foot up the handsome sum of \$3,500,000, and it is to be presumed that none of these dealers have overstated their sales. To this amount may be added \$1,500,000 worth of goods purchased on private account for miners' winter stores, and for the supply of incorporated companies and quartz mills, making in total a valuable trade of about \$5,000,000 annually.

The wealth and population of a section, and the influence and circulation of an old established paper, determine its value as an advertising medium—a matter never lost sight of by an experienced advertiser.

The *Messenger* is one of the oldest and best established papers in the State, and has always enjoyed an extensive circulation (wholly unaided by party contributions) equaled by no other in this locality at any time during the last ten years, and has entered upon its thirteenth volume with increased subscriptions and extended advertising patronage. It has been twice enlarged since its removal from La Porte to Downieville, in 1864, and now presents more reading space and type than any other weekly local journal in the State (not connected with a daily issue), and more local matter. No business man is without it, and its circulation extends throughout the mines in all the different camps of this county and vicinity, as follows: Forest City, Aleghany, Chips' Flat, Minnesota, American Hill, Sierra Valley, Downieville, Goodyear's Bar, Camptonville, Eureka, Port Wino, La Porte, Sawpit Flat, Gibsonville, Newark, Poker Flat, Howland Flat, Pine Grove, and St. Louis, besides many other smaller camps.

The *Messenger* has an extensive job office, and does the printing and advertising of the county.

Continued Subscriptions.

For the reason that it is not always practicable to have our agent call upon subscribers for a renewal of their subscriptions as soon as their terms expire, we shall, when requested, continue to send the paper until our Collector calls around. This will only apply to old subscribers in the State of California, whose residences are within our regular canvassing routes. If the subscription is not promptly paid when the Canvassing Agent calls, the paper will be immediately stopped, and the bill left with the postmaster or express agent for collection.

It is not our intention to send the paper beyond the time desired by any subscriber, and should we accidentally or inadvertently do so, we shall expect the subscriber to send us written notice to discontinue.

By Law any person taking a paper from the post office is liable for payment. The Courts have decided that removing without giving notice to the publisher, and leaving the paper uncollected for, is *prima facie* evidence of intentional fraud on the part of a subscriber.

No new subscriptions or renewals received without payment in advance.

August 1, 1866.

Auction House.—Messrs. Olney & Co. have opened a General Auction and Commission House, No. 418 Montgomery street—a very central and convenient location. Mining and other Corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Besides every kind of auction business, this firm will pay special attention to the purchase and sale of real estate in Oakland.

Boiler Makers and Sheet Iron Workers. Mission Street, between Beale and Fremont, San Francisco. N. B.—All kinds of Boiler and Sheet Iron Work executed at the shortest notice, and on the most reasonable terms. MOYNIHAN & AITKEN.

HEPBURN & PETERSON'S PANS AND SEPARATORS. For Reducing and Amalgamating Gold and Silver Ores.

We invite the Mining Public to examine the record of our Machines before adopting any other for producing similar results. They have been in general use for the past three years, during which time they have been repeatedly tried in comparison with every other machine of note, and of a similar nature, and have invariably been adopted in preference; which facts we offer as the most suitable recommendation, and which is attested by the following list of

REGULAR MEETING, Monday, Sept. 17, 1866.

Vice-President Stearns in the Chair.

Nine members present, and Dr. P. Comrie, visitor.

Minutes of previous meeting read and approved.

Messrs. B. P. Avery, Jns. Spiers and B. R. Norton were elected resident members.

Mr. Hanks proposed Mr. Winslow Boynton, and Mr. Bradley nominated Mr. T. C. Leonard for resident membership.

Donations to Library.—Proceedings of the Mannheim Academy, by Dr. Behr.

Mr. Stearns, in behalf of Dr. J. G. Cooper, of Santa Cruz, laid before the Academy a paper upon a new species of *Pedipes*, from San Pedro; also, a paper from Dr. C. A. Canfield, of Monterey, upon a new species of fish of the genus *Deltostoma*. Referred to Publication Committee.

Mr. Falkenau stated some interesting facts in connection with the Spectroscope, its uses and value in a scientific point of view.

Dr. Comrie made some remarks upon glacial indications at Vancouver Island and vicinity. Adjourned. T. H. BLOOMER, Rec. Sec.

THE USE OF THE SYPHON IN MINES.—We are pleased to notice that the communication, with comments, which we gave three weeks since, on the introduction of a syphon into a mine at You Bet, in Nevada county, has called forth several communications, giving the experience of other parties in the use of the syphon for draining mines. Two of these communications were given last week, and three others are given in this issue. It would appear, from these several communications, that the syphon may be advantageously used, under certain circumstances, for raising water from moderate heights. Our correspondents have given in detail their various experiences in introducing this cheap mode of drainage, and their personal cannot fail to prove of much interest and value to others who may be contemplating its introduction, or who may now, for the first time, learn that it is practicable. The subject also furnishes additional proof of the benefit which always accrues to the general mining public from a publication of the experience of individuals, in any particular process or procedure which may be included within the wide range of mining operations. We are always pleased to hear from practical men upon subjects of general, mechanical, mining or scientific interest.

BARREL AMALGAMATION.—By reference to the advertisement of Brodie & Radcliff, which appears to-day in our columns, it will be seen that those using or intending to adopt their improved amalgamating barrel, will pursue an economical course by settling for the royalty prior to the 1st November next, after which day this advance will be 100 per cent. on present charges.

BRODIE'S PATENT WIND BLAST SEPARATOR FOR DRY CRUSHING.

In consequence of the interest created respecting dry crushing, resulting from the reports recently circulated of successful experiments made with dry crushing and superheated steam at Bear Valley, we, this week, present our readers with a sketch and description of what is claimed as one of the most effective dry stamping mills yet known. It was invented, some time since, by Mr. Brodie, a well-known mechanic of this city.

The Patent Wind Blast Separator is an application to a stamp-mill or other crushers, by which the ores are crushed dry, with a large

escape from the crushings to the injury of men or machinery.

Touching the quantity or analogy between dry and wet crushing, it is claimed that more work can be done in a given time by dry than by wet crushing, and to better advantage, as the wealth contained in the ore is under control until it is obtained in the form of amalgam. In wet crushing the muddy water carries off a large portion of the fine gold.

This apparatus has been tried in Mexico and Nevada. In the latter place a 10-stamp mill was erected at the Boston and Nevada mine, Austin Reese River, the millwright of which certified that it crushed, into the finest impalpable powder, thirteen tons of quartz

BRODIE'S PATENT WIND BLAST SEPARATOR FOR DRY CRUSHING.

percentage in favor of dry over wet crushing. The accompanying engraving exhibits a cross section of a battery with the Wind Blast Separator attached, showing the mode of application to any battery or crusher, doing away with the expense and use of screens. Letter A represents a fan to drive a current of air into the battery, raising the fine dust from under the stamps; it is then drawn out through box, B, by a suction fan, C, and passes through pipes into the ore-room, D, where the ore is deposited. The wind created by the fans passes into the dampening chamber, E, where any ore that may escape from room, D, is dampened by a jet of steam, and falls into box, G, which is filled with water; the wind and steam passes out at the chimney, F; the direction of the arrows shows the action of the wind on the crushed ore in its transit from the stamps to the ore room; so it can be seen that none of the ore or dust can

rock in twenty-four hours. We are informed that steam has been employed as above described, for the purpose of dampening the light ore so long ago as 1859.

For further particulars, inquire of Messrs. Brodie & Radcliff, whose advertisement will be found in this paper.

A MECHANICAL STREET SWEEPER has been introduced into this city. It may be described as a kind of a covered wagon, with sets of sweepers ranged diagonally around a central shaft, operated by the wheels of the vehicle. The plan of its operation is to throw the dirt to the side of the street in a winnow, when it can be readily gathered up by a few men with shovels.

STOCKTON FAIR.—Our correspondent furnishes us a good report, too late for this issue. It will appear in our next.

THE SCIENCE OF HANGING.—The Rev. Samuel Houghton, of England, has recently published some remarks in the London *Philosophical Review*, on "Hanging Considered from a Mechanical Point of View," which are worthy of consideration by all humane people. In executing the extreme penalty of the law, every means which science can devise should be employed in rendering the culprit's exit attendant with as little pain as possible. Death by hanging is produced in three ways only. First, By apoplexy, caused by pressure on the jugular vein. Second, By asphyxia, caused by stoppage of the wind-pipe. Third, By the fracture of the vertebral column. In the first two cases death is preceded by terrible convulsions, caused by the cessation of the supply of arterial blood to the vesicles, and lasts from five to forty-five minutes. In the third case, it is instantaneous, painless, and unaccompanied by any convulsive movements.

In England and Scotland, a short drop of only three or four feet is used, which is generally insufficient to fracture the vertebral column, and subjects the criminal to a terrible and protracted death. In Ireland, a longer drop is used, which generally produces instantaneous death. A safe rule for the length of the drop is given, as follows: Divide the weight of the criminal (expressed in pounds) into 2,240 (a ton weight in pounds) and the quotient will give the required length of the rope in feet; thus, a criminal weighing 160 pounds, should be allowed a drop of fourteen feet. A shot attached to the feet of the criminal, by adding to his weight, might allow of a decrease in the fall, when desirable.

The American method generally adopted at the present time, is a sudden lifting of the criminal into the air, by means of a heavy weight attached to the opposite end of the rope, which should pass over a pulley placed vertically over his head. This method is highly approved of by Mr. Houghton, as producing less suffering than the "long drop;" seeing, that although death by the long drop is instantaneous, upon the occurrence of the actual shock, yet there is an interval of a second or so between the commencement of the fall and the shock, in which the criminal must suffer an immense amount of mental agony which should be spared him, and which is altogether avoided by the American practice.

Hops formed quite a prominent feature in the late Fair at Sacramento. The quality of California hops is universally conceded to be superior to any that can be imported. Their cultivation may now be considered as among the most profitable of our agricultural speculations. It is stated that Wilson Flint has raised on his farm, near Sacramento, 25,000 pounds of hops this year. They are worth eighty cents per pound in this city.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Notes on the Chief Gold Districts Throughout the World.

BY PROFESSOR ROWLANDSON, F. G. S. L.

[Continued from Page 162.]

AUSTRALIA, NEW ZEALAND, ETC.

EDITORS PRESS:—The third epoch comprises the strata which contains the Australian coal beds. It overlies a coarse sandstone containing spirifer and conularia, a conglomerate forming the immediate floor. The fauna and flora of this epoch will be more fully alluded to subsequently. The fourth epoch consists of loose sand and pebbles, drift, elevated beaches, etc., amongst which are the gravels and clays of the "gold diggings," though at the time Count Strzelecki published his "description," the existence of valuable gold fields in Australia was unknown. Amongst the most remarkable of these accumulations is the osseous breccia, found in caves in Wellington Valley, consisting of detached and fragmentary bones, some of which are new to naturalists, as the *Diprotodon*, an animal described by Owen, as participating in the mixed character of the existing Wombat, Kangaroo and Tapir; and the *Nototherium*, which the same high authority assigns to a class of ancient vegetable-feeding marsupials, which attained the size of the modern Rhinoceros. Other remains found in these bone caves, as the *Macropus*, *Hypsiprimum*, *Pharcoloneys*, *Dasyurus*, *Thylacinus*, have been described as merely presenting typical forms of existing species. If the statement made by Count S. is subsequently confirmed, namely, that the entire thickness of the stratified rocks in New South Wales, including mica schist in the list, does not exceed 2,200 feet, in which the sandstone alone (above the coal) is 1,400 feet, the fact would account for many seeming geological anomalies.

It may be well to remark that this extremely shallow character of the sedimentary strata in New South Wales may possibly account for the fact stated by Mr. Selwyn, that he has determined sixty species of Silurian fossils, including graptolites, trilobites and lingulae, amongst the slaty rocks of Victoria, and it is presumed contiguous to its celebrated gold fields. Mr. S. has also given it as his opinion that there are three gold drifts in Victoria, formed at three different epochs, one of which he ascribes to as ancient a period as the Miocene of the tertiary. How far this theory will be supported by subsequent observations it is impossible to say, in the present state of information; if eventually proved to be correct, the writer of these articles will be compelled, in some degree, to modify his opinion as to the age in which gold veins were formed in many parts of the earth; nevertheless, he cannot accede to the probability that Mr. Selwyn's opinion is correct—that the gold quartz veins of Victoria are older than the granite; at all events, in any material degree, the conclusion of Mr. S. is probably based on the belief which he has expressed, that the auriferous veins of Victoria are confined to rocks of the Paleozoic age. This may be the case in many or all instances, yet, the formation of the gold veins may be long subsequent to the rocks inclosing them, and synchronous with, and also emanating from the same causes which formed and erupted the granite, etc.

FOSSIL BOTANY OF AUSTRALIA.

The fossil flora of Australia, collected by Count S., was but of a meager character, so far as numbers were concerned, and are referable only to two distinct geological epochs: first, that of the deposition of coal and superincumbent sandstone, and second, that of the yellow (tertiary) limestone around Hobart Town, which contain impressions of leaves of an unknown vegetation, accompanied by a *Helic* and *Bulimus*, not identified with any existing forms.

They were submitted to Professor Morris, of University College, London, whose remarks thereon follow: "In reviewing the few species of the ancient flora that have been hitherto

collected from the carboniferous deposits of Australia, including therein the fossil plants from the basin of the Hunter in New South Wales, and those from the Jerusalem basin in Van Dieman's Land, we at once perceive the interesting fact, that, although limited as the species are in number, there is no trace of any of those remarkable genera, so characteristic of, and so abundant in the strata of the European and American coal fields, such as *Lepidodendron*, *Sigillaria*, *Stigmaria*, *Calamites*, and *Conifera*."

The basins named, if contemporaneous, are characterized by different flora; no species having been found common to the two deposits. The basin of the Hunter contains *Phyllocladus australis*, *Glossopteris browniana*, and some other species. In Van Dieman's Land are found three or four species belonging to the genera—*Sphenopteris* and *Pecopteris* and a *Zeugophyllites*, associated with some large fragments of stems of too imperfect preservation to be defined. The *Zeugophyllites* and certain forms of *Pecopteris* were collected in Van Dieman's Land, one of the latter being closely allied to the oolitic species of Europe, and another bearing a strong resemblance to an *Odonopteris*, found in the Permian System of Russia. Professor M. further remarks: "These few observations partly lead us to infer that the flora of the Southern hemisphere was perfectly distinct in its facies from the Northern, at the carboniferous period. Just as at the present time, the modern flora of the same continent presents a striking difference to that of other portions of the globe; and this appears the more remarkable, as the species constituting the fauna of the Australian Ocean, anterior to that period, contains many forms, which, if not perfectly identical, are at least the representative ones of those of the northern region." Professor M. makes a comparison too lengthy to extract between the Australian carboniferous period and that of the Burman coal field of Hindostan, assigning an identity of age to the two, and assuming that the conditions of the flora of some portions of India and Australia were contemporaneous, or, if not identical, not greatly dissimilar, and concludes by illustrating a comparison between species found in the oolite of England with that of Australia, by which he remarks that a striking analogy of form is perceptible.

In the concluding chapter we shall again have occasion to refer to this part of the subject. It may, however, be here stated that in the course of the years 1831 and 1832 the writer had various conversations on this subject with Professor Morris, as, also, with the late Professor Edward Forbes, in the course of which Professor M. stated that subsequent consideration had induced him to incline to the opinion that the carboniferous strata of Australia belonged rather to the secondary than the true carboniferous period. The late Professor E. Forbes held even more decided opinions on this point, though he did not deem the evidence at all conclusive. These points will be treated hereafter.

PALEONTOLOGY OF AUSTRALIA AND VAN DIEMAN'S LAND.

So far as information has been received by the writer, the fossil fauna of Australia is somewhat remarkable for the absence of certain genera, which are found in northern deposits of presumed coeval time. It is not known to the writer that any traces have been found of *Nautilus*, *Clymenia* or *Goniatites*; *Trilobites* are rare, and the crustacean family is represented by two or three species belonging to cypridiform genera. *Bellerophon* and *Conularia*, seven or eight varieties of spirifer, two or three of which assimilate to the gibbose species productus, are not unfrequent, presenting a facies resembling that assigned to the carboniferous era of the northern hemisphere. The Silurian fossils found by Mr. Selwyn have already been noticed.

NEW ZEALAND.

Nothing is known of the geology of this gold region, further than that as with other gold, and it may be stated, also, perhaps, with only one exception, the remark applies to other metalliferous districts, the gold fields of this island are associated with granitic and similar outbursts.

How to KEEP SHEEP FROM DOGS.—It is stated that if sheep are kept in the same lot with cows or fat cattle, no dog will disturb them. As soon as the dogs approach the sheep, they run to the cattle who drive the dogs off. A farmer for thirty years, by adopting this plan, never lost a sheep by dogs.

To some men it is indispensable to be worth money, for without it they would be worth nothing.

[Written for the Mining and Scientific Press.]

More About the Use of the Syphon in Mines.

EDITORS PRESS:—I have read the communication from "You Bet," and your comments thereon, concerning a syphon in the mine of Messrs. Neece & West. After a good deal of experience in that line, I have arrived at the following conclusions, to which you and your readers are welcome, to be taken for what they are worth: At this altitude the syphon, when properly laid down, will do pretty good work in raising water as high as twenty-five feet, assuming that there is good air in the mine. I give the smaller sizes of lead pipe the decided preference. One-inch pipe I have found to give the best satisfaction, with a short piece, say of twenty-five feet, of larger pipe on the inside end. Where a pipe of this size will not free the mine from water, I would prefer two or more to a larger one. An important preliminary step is to have a properly-constructed reservoir—the larger the better—the water in which should be disturbed as little as possible. Where new pipe is used, which, of course, is to be preferred, when it can be done, take the reels containing the pipe to the mouth of the tunnel. Take one reel at a time on the truck of a common hand-car, and commence laying the pipe from the inside, unwinding the pipe from the reel as the car is pushed towards the mouth of the tunnel; have no more joints than are necessary; extend the pipe so far outside and below the mouth of the tunnel as may be necessary to have the outer arm the longer and lower. Have no funnel or other fixtures at the summit, but within a few feet of the outer end solder in a gauge-cock, and place a suction pump at the extreme lower end, to which attach the pipe with a coupling. In starting the water for the first time, it may be necessary to have a small force-pump on the inside, to assist in filling the pipe, proper precautions being taken to not hurt the pipe. After starting, inclose the inner end with an ordinary five-gallon kerosene can, punched full of small holes, which must be seen to and kept open. Regulate the flow with the gauge-cock, it being important, as you suggest, to keep the inner end constantly submerged some distance below the surface. By making the suction pump solid, and allowing the pipe to remain permanently coupled to it, when the stream slackens up too much, it will be a small job to start it up with a small turn at the pump. I will close by saying, in the laying of the pipe avoid all acute curves, and see that it is properly guarded from "jamming." C. J. H.

Forest Hill, September, 1866.

A letter, dated Gold Hill, Nevada, Sept. 6, 1866, says:

In a number of your paper of the 1st inst., I notice an inquiry in regard to the use of syphons in mines. During my experience, I have had occasion to use them on two different occasions and in different mines. The first one was 675 feet long, to draw water from a drift which was run with a down grade of two feet in 100. When in with the drift about 500 feet we cut water, and were obliged to use a syphon to free the drift. The following will give you an idea of its workings:

A was the end, afterward in sump, to which was attached a small basket to keep out gravel. B, the highest point, about fourteen feet above A; the top of the projection, B, was about twenty-four inches above the pipe. We filled it at this point with a funnel, a person holding his hand over the end at A. C was another upright with stop-cock, used as a vent for the air to escape when filling. D was the discharge, eighty feet below drift, level with stop-cock, to work with wire from drift. When the syphon was full, we closed the cocks at B; the person at C tapped on the pipe for man at

A to look out; the cock at D was then opened, when the man at A would feel his hand sucked in the pipes, upon which he withdrew his hand, keeping the pipe under water and putting on the basket. We ran the drift some 100 feet further by adding a pipe as requisite. Sometimes the syphon would start without any trouble; at other times, some five or seven fillings were made before it would work. Persons posted on hydraulics told me a pump would be of use only at the point D, where we could not use it, as the cage was constantly passing up and down the shaft. One day my temper was well tried, when I determined to experiment. I purchased a small two-inch Douglas pump (the pipe of syphon was one inch and a half), put the pump on at point B, shut cock at D, and left A open in water. Told a man to shut cock C; pumped myself for about one half hour and no success; could not see why should not raise water; set man to pump and examined cock C; found it leaking air—it did not shut tight; afterwards luted with clay, shut the cock and filled with water, and pumped again; kept increasing the vacuum, and in a moment had full head of water; closed cock under pump at B, and opened cock D, when it went well and would run for weeks. When it lost water, I could start it in ten minutes with the pump. The syphon contained numerous flexures, similar to the one you describe at Neece & West's mine.

Still another letter, dated Mokelumne Hill, Sept. 9th, says:

EDITORS PRESS:—As you ask for information in regard to the practical working of syphons, I take the liberty of addressing you, and will state the following as a fact: A syphon will work from one to five days by attaching air-chambers at proper intervals over the pipe. The number and size of chambers will govern the working of the syphon.

To illustrate, I will use the diagrams in your issue of September 1st. Attach air-chamber No. 1 at the curve exactly over the well; chamber No. 2, 225 feet from the well; No. 3, 275 feet from the well. This will place the third chamber within twenty-five feet of the last section, which has a good fall for 100 feet. To exhausting the air from the pipe to start the syphon, a portion of the air in the chambers is exhausted at the same time, and the water, as it passes along the pipe, fills the space of exhausted air in the chambers. Now, if any air in the form of air-bubbles should enter the pipe with the water, it will most certainly take the place of the water in air-chambers until they become overcharged, when the water is pressed back and stops running. Perhaps this may not be the correct theory. I give you the facts, in my experience, as regards the working syphons with air-chambers. The form or shape of chambers is merely a matter of taste; but for convenience of attaching them to the pipe, I usually make them funnel-shaped. This shape gives the workman that attaches the chambers to the pipe a fair chance to see what he is about, and there is no fear of making a leaking joint. I make them of galvanized iron.

Mokelumne Hill, Sept. 9th, 1866. H. R.

FALL RIVER will soon take the lead of Lowell as a manufacturing city. It is said that when the mills now in process of erection there, are completed, it will have more spindles than Lowell, and be the first city in America in the amount of cotton and woolen goods manufactured. A large part of the machinery is moved by steam. The natural advantages of Fall River as a manufacturing city, are not excelled by any city in the world.

LARGE ISSUE OF PATENTS.—The number of patents issued for the week ending August 14th, was 275, the greatest number ever issued from the U. S. Patent Office in any one week. On Tuesday, the 7th of the same month, 92 patents were issued, the largest ever issued on any single day. The inventive genius of the country was never more active than at the present time.

A PATENT fish scaler is the latest Connecticut invention.

Mechanical.

A New Material for Roofing.

The production of a cheap, incombustible and durable roofing material is a matter of great public importance. It is a question about which much has been said and written, and a large amount of money and time has been spent in aiming at a satisfactory solution of the problem. The value of a really safe and reliable substitute for the numerous unsafe and unreliable materials so generally employed in this city, could scarcely be calculated. Our long, dry summers, with high winds, render a combustible material highly dangerous; and the great extremes of contraction and expansion between summer and winter, makes the nuisance of "patching" a matter of frequent necessity, and often a most ineffectual remedy against a pluvial interference with one's domestic arrangement, household goods and perishable stores.

An interesting discovery in this direction has been made by Wm. L. Potter, of Clifton Park, N. Y., and by his permission was announced to the world about a year ago, through the Farmers' Club of the same State. Solon Robinson, of Ohio, having carefully examined into the merits of the discovery, also gave the weight of his influence in its favor; and in a few months, according to the report which has reached us, the company which had been organized in New York city for its manufacture, was completely overrun with orders.

The material employed is common slate rock ground to a fine powder, and in that state mixed with mastic or any bituminous substance to the consistency of a thick paint, in which condition it is applied to canvass, cloth, paper, felt, or any similar substance. It soon hardens, and by the action of the elements or by means of chemical action within itself, becomes so indurated as to be almost as impervious to the action of fire or water, as slate rock itself, though less brittle.

Slate-stone and coal-tar are too well known to require a description. Associated in geology—perhaps originally combined, an affinity is found to exist, and the slate being pulverized and brought into contact, a union is formed of so firm a nature as to yield only to extreme heat or great violence.

A material—at once cheap and abundant in every civilized country on the globe, so simple in preparation and application that common sense is the only qualification for using it. A mastic—it adapts itself to every shape and condition. Adhesive—it needs no nails or hooks to hold it. Non-combustible—it is not the means of destroying your property, but of protecting it. Impervious—water, nor even steam, can penetrate or dissolve it. Repairable—"a little more of the same sort" and a brush or trowel restores it from accidental injuries. Renewable—the waste from the friction of falling water may be returned once in ten or twenty years forever by the use of the brush.

This mastic, it will be readily inferred, is a very different material from the substance usually employed in this city, which consists of a mixture of asphaltum and coarse waterworn gravel. There is in this new preparation an intimate mixing and combining of the material, by having the slate first pulverized to an impalpable powder, and in that state brought into contact with the adhesive substance.

There are various other uses to which this material has been applied, such as cement for cisterns, tanks, cellar floors, leaky hydrants, pipes, pumps, etc. Inkstands have been made of it while in a plastic state, which have become as hard as stone. It has been applied as a cheap paint to out-buildings, fences, etc., where it prevents decay. Experiments with this new material were in progress for ten or twelve years, before it was fully made public, a year ago last June.

A USEFUL CEMENT is made by taking two parts of finely sifted unoxidized iron filings, mixing them with one part of perfectly dry and finely powdered loam, and kneading the mixture with strong vinegar until a perfectly homogeneous plastic mass is formed, when the cement is ready for use. It must be made as wanted, for it quickly hardens, and once set is never fit for use again. The cement is said to resist fire and water.

OBSERVATIONS made upon twenty-six coke-burning engines, upon the London and South-Western Railway, showed that the duration of a set of brass tubes of No. 13 gauge was from 65,000 to 127,080 miles, averaging 94,518 miles.

WELDING BOILER PLATES.—A cylindrical boiler, four feet in diameter, with an internal flue, has recently been made in England, with welded joints throughout, not one rivet being used. The plates are of 7-16 in. iron, and the boiler was tested without leakage to a pressure of 150 lbs. per square inch. Mr. Hackworth, an English mechanic, constructed a locomotive boiler some sixteen years ago, the longitudinal joints of which were welded instead of being riveted.

The larriving of boiler plates so frequently observed in English locomotives, is unknown in this country. The very thin iron used in the construction of boilers, would not admit of such a practice. The English boiler makers reduce the strength of the entire boiler to what would be equal to iron of the thickness of the plates at the lines of the furrows. All the excess of thickness in the plates above the parts at those reduced lines is so much iron worse than wasted.

WATER AS A LUBRICATOR.—In an issue about a year since, we gave a detailed account of some experiments in the use of water as a lubricator. We find the following paragraph in relation to the same matter in the London Mining Journal:

The North-Eastern Railway Company's carriage fitted with Aert's water-box, on Sept. 4, last year, has been running ever since between Newcastle-on-Tyne and Normanton; and Mr. Pelsenaire, the representative of the inventors in this country, writes that during that time the boxes have required no repairs, nor has anything but water been used. Under the same conditions, the second carriage has been running six months. The experiment has been made under the control of Mr. Edward Fletcher, the engineer of the company, and Mr. Pelsenaire has offered to furnish 5,000 or 8,000 boxes at 4*l.* 10*s.* per box, royalty included, or to receive 1*l.* 10*s.* per box royalty, in the event of this company undertaking to make their own boxes. If the system be admitted to be good, and the refusal is only based on the cost of applying it, that fact should be distinctly stated by the railway authorities, as their silence must be very prejudicial to those interested in the invention, by preventing them from finding another market.

A USEFUL CHART.—Mr. Charles Kinkel, of New York, has published a diagram for ascertaining the width of helts to drive any given machine. This diagram is accurately drawn, and is accompanied by an explanation of its use. From it any one can tell by simple arithmetic what size of belt he requires to do his work. We have not seen the chart, and know nothing of the principle involved.

A CHANCE FOR INVENTORS.—A premium has been offered by the Industrial Society of Amiens, in the following terms: The proprietors of steam engines are in want of a water meter which will indicate exactly the quantity of water injected into the boiler, whatever be the pressure. This apparatus must be one easily set up, not subject to get out of order, and capable of registering the quantity of water to within two per cent. of the actual volume. It is not a memoir that the society wishes for, but an apparatus in working order on which experiments can be made; and if a water meter be presented appearing to be of practical utility, the society will use every effort in its power to promulgate the use of the contrivance. The meters to be experimented on should be sent to the office of the society before March 1st, 1867.

In the case of a fatal boiler explosion which occurred at Toronto, Canada, in 1857, the coroner's jury stated in their verdict, that the introduction of spirits of wine, oatmeal, and sal ammoniac into the boiler, for the purpose of removing the scale, had caused the water to foam, thereby deceiving the firemen as to the true water-level, and thus leading to the explosion.

CAREFUL observations have shown that the temperature in the smoke-boxes of tubular marine boilers is greater at the base of the chimney than opposite the ends of the tubes. With a temperature of 650 degrees, opposite the tube ends, there are often 1,000 degrees in the upper part of the up-take.

MR. DEWANCE found that the square heads of stay bolts, when projecting $2\frac{1}{2}$ inches into locomotive fire-boxes, burned off to $1\frac{1}{4}$ inches, at which projection they remained.

THE "split bridge" for the admission of air at the back of steam boiler furnaces was invented by Josiah Parkes, in 1820.

Scientific Miscellany.

A New star—Remarkable Developments.

What is supposed to be a new star has recently been discovered in the constellation of the Northern Crown. The star was first seen on this continent on the 12th of May, by a pupil of the Friend's High School, in Philadelphia. It was also seen on the same night by Prof. Tutweiler of Havana, Green county, Georgia. It was seen in Boston on the 14th. Each observation was unknown to and independent of the other. It was seen on the 13th of May at Rochefort, France, and on the 12th in England, by Mr. Birmingham of 'Eum. The difference of time between England and the United States, gives to this latter gentleman the honor of priority of discovery.

The great number of points at which this star was almost simultaneously detected, as a stranger to our planet, shows how closely the heavens are watched, and how familiar, even to amateurs, are the principal stars visible to the eye.

The star, when first seen, was of about the second magnitude; but it rapidly, and at the same time uniformly receded in brilliancy, until at last accounts, it had become reduced to about the sixth in point of magnitude.

The most important observations made with regard to this star have been the development brought out by the spectroscopic, applied to it by Mr. Higgings, of the Royal Astronomical Society of England, who kept a constant watch of it from the 16th to the 21st of May, during which time it passed through some most extraordinary phases. When first seen, it was a bright star of nearly the second magnitude; on the 15th and 16th it had assumed a nebulous appearance with a central nucleus; on the 17th and 18th this nebulosity had entirely disappeared. What strange, what stupendous changes must have been wrought in that distant orb, within those five or six days!

A few years ago, we had no means of even the most distant guessing at the nature of these changes. Of late, however, the genius and scientific researches of man have placed within the hands of the astronomer a curious instrument which is able to detect, with almost unerring certainty, the constituents of all incandescent or burning bodies, which may be brought within the range of observation. This singular instrument is the spectroscopic, which, in the hands of Mr. Higgings, and applied to this remarkable star, has been made to develop some most wonderful phenomena in scientific researches, and has led astronomers to most unexpected conclusions with regard to the physical constitution and condition of our new heavenly visitor.

It has been ascertained that the light of this star is compound, and emanates from two distinct sources, each of which forms its own spectrum. The principal spectrum is analogous to that of the sun, and is derived from a light emitted by an incandescent solid or liquid body, but which has suffered partial absorption by passing through an atmosphere of vapors existing at a temperature lower than that of the central and more dense incandescent body.

The secondary spectrum is formed by a light which must be emitted from matter in a state of gas—undoubtedly the gas surrounding the incandescent nucleus already alluded to. On the 17th of May, this secondary spectrum gave the most unmistakable evidence of burning hydrogen, produced by the induction spark. This appearance continued up to the latest reports—the 21st of May—the only changes being a gradual reduction in brilliancy.

"The sudden blazing forth of this star, and the subsequent rapid fading away of its light," says the observer in his communication to the Royal Astronomical Society, "suggests the rather bold speculation that, in consequence of some great internal convulsion, a large volume of hydrogen and other gases were evolved. The hydrogen, by its combination with some other element, (the spectra of which do not coincide with those of oxygen) giving out the light represented by the bright lines, and at

the same time heating to a point of vivid incandescence this solid matter of the photosphere. * * * These and other important observations we have made, suggest that hydrogen probably plays an important part in the changes and physical differences of this stars. * * * On the 18th, I several times received the impression of a bluish tinge, as if the yellow of the star were seen through an overlying film of blue tint."

Another astronomer expresses the opinion that this star will turn out to be a *variable* one of long and irregular period, instead of a new one.

THE SUFFOCATION OF FIRE.—One of the most notable instances of extinguishing a fire which could not be reached by water was that of a coal mine in Scotland, in 1834. It had been burning thirty years, and huffed all efforts to extinguish it. Mr. Goldsworthy Garney, who was distinguished for the application of the steam jet for ventilating mines, was asked if he could extinguish it. He undertook the work. He covered all the openings of the mine, leaving only two holes, into one of which he forced steam, mingled with the products of the combustion of a coke fire, which generated impure carbonic acid and nitrogen. In six weeks the fire was extinguished, but then a new difficulty presented itself—how to cool the heated mine, so that when fresh air was re-admitted, combustion would not again begin. This was, however, effected, by mixing a spray of water with the jet of suffocating gas. A process like this would instantly extinguish any fire, where the air can be kept out, and if the gas was well purified, it would not soil goods which might be exposed to its influences.

LINE OF THE SOLAR SPECTRUM.—Many years ago Brewster discovered in the solar spectrum certain dark bands which become more and more marked as the sun descends. These bands have been resolved into fine and well-defined lines, visible in different degrees, at all heights of the sun. They are now supposed to be visible, only by reason of our atmosphere, or by the presence of the vapor of water in it. At a height of 2,682 feet in Switzerland they are much less visible than on the plain. What seems a further and conclusive proof that the cause of these lines resides in our atmosphere is, that when at that height a bonfire was examined *near by*, the spectrum was continuous, but when the same flame was examined *from a distance*, they were very plain.

A NEWLY DISCOVERED CHARACTERISTIC OF SULPHO-CYANIDE OF AMMONIUM.—The London *Journal of Science* says that a notice of an interesting property of sulpho-cyanide of ammonium has been published by Mr. F. Cowles. He finds that when dissolved in water this salt produces intense cold; i.e. a short time the atmospheric moisture hanging deposited like hoarfrost on the sides of the vessel.

This led him to try a few experiments with weighed quantities of water and of the salt. From a few trials with different proportions, it appeared that the mixture of equal parts by weight gave the most intense cold. By mixing 1,368 grains of the salt with its weight of water at 17° C., a cold of 12° C. was obtained. The temperature of the atmosphere at the time of the experiment was the same as that of the water employed.

INTERESTING EXPERIMENT.—M. Courdehoy introduces an electro-magnet into the circuit of a galvanic pile, and breaking the circuit, places the ends of the two conducting wires, separated one from the other, in a box containing metallic filings. If now one of the conducting wires he slowly raised, a small chain, consisting of the cohering fragments, will be drawn out, every particle in the box adhering.

EGGS.—Some ova or eggs are so small as to be wholly indistinguishable by the eye, while M. Geoffroy de St. Hilaire, in 1854, exhibited to the French Academy some eggs of a bird which formerly lived in Madagascar, the largest of which was over one foot long, and nearly as wide. This egg would hold nine quarts.

SCHONBEIN states that a weak solution of peroxide of hydrogen may be prepared by shaking violently for a few seconds amalgamated granulated zinc with a little distilled water contained in a large bottle. Oxides of zinc and peroxide of hydrogen are formed, but no zinc or mercury is dissolved.

It is stated that a few drops of a solution of permanganate of lime, added night and morning to breeding tanks, sweetens water, supplies oxygen and thus diminishes the mortality in fish hatching.

THE motion of locomotive engines upon the rails is believed to assist materially in liberating steam generated in the lower parts of the boiler, and thus in maintaining a proper circulation of water.

TO INVENTORS

ON THE

Pacific Coast.

Messrs. DEWEY & CO.

Take occasion to call your attention to the following rules, regulations and suggestions relative to the obtaining of LETTERS PATENT of the United States:

Self-Evident Facts.

Having had large experience, and gratifying success with the great variety of cases emanating on this coast, we feel confident of our abilities to assist inventors in patenting their inventions, saving them from vexatious delays, and from receiving worthless papers by reason of imperfect preparation of their claims before being sent to the Patent Office.

The branch of Patent Law is of itself a SPECIALTY of legal jurisprudence; or, as Mr. Phillips, an eminent Patent lawyer, justly remarked: "The metaphysics of the law."

In early days but little preparation was needed, but ordinary skill required to obtain a patent; but now, by reason of the multiplicity of inventions, and the numerous acts of Congress, found necessary to protect the inventor while the patent lasts, and to do justice to the people after it expires, the utmost care and skill are requisite in managing cases and obtaining a patent that will be of real value to the Patentee, and stand the test of passing through the legal ordeal of an infringement suit.

The general practice of the Patent office regarding the examination or issue of Letters Patent for inventions has not been materially changed for many years, yet there have been amendments added to the laws of 1861, 1863 and 1866, and which it is necessary for all parties managing an application to be conversant with. Old inventors invariably advise the employment of none but agents of responsibility and experience. As agents with such qualifications, we solicit your patronage.

Confidential Advice.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice we make no charge. A pen-and-ink sketch and description of the invention should be sent together with a stamp for return postage. Write plain, do not use pencil or pale ink; be brief.

Remember all business committed to our care, and all consultations, are kept by us secret and strictly confidential. Our permanent business interests demand, as it were, a sacred compliance with our obligations as solicitors, and in reference to our strict fidelity in this respect we refer to one and all of the hundreds of inventors and patentees on this coast who have patronized us.

Letters Patent.

A patent is an open letter, embodying all the language of an inventor or his agent, contained in the specification, without alteration, and is granted to citizens of the United States, or those who have declared their intention of becoming such, and is signed by the Secretary of the Interior and the Commissioner of Patents, with the seal of the Patent Office affixed. Its jurisdiction is for the whole United States, for the term of seventeen years.

A patent right is personal property, and is assignable, but cannot be seized and sold on execution.

What Claims can be Patented?

A knowledge of Ancient and Modern Mechanics and familiarity with American and Foreign patent issues and rejections, enables us to determine in a measure in all cases what can be patented, and how much can be claimed as new and novel, and be covered by Letters Patent. This is one of the most difficult questions encountered by both old and new inventors—one in which an experienced counsel is of great service—and yet it can never be positively determined except by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate drawings and payment of the first government fees.

Steps Necessary to Procure a Patent.

The first thing required is a model, if your invention can be represented by one. It is not only immediately necessary in preparing the papers, but the law demands that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions. A less size model will answer when more convenient. It should be neatly made, and of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it in a permanent manner.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express, or otherwise, to our address, namely: DEWEY & CO., Mining and Scientific Press, San Francisco. Prepay expenses and send express receipt to us by mail.

A full description must also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance, stating the name and address of the sender. On the receipt of the model and Government first fee of \$15 in currency, the case is duly registered on our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government last fee of \$20 in currency will be required. The law states that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication, as the business can be well done by correspondence.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished, with full description of the entire preparation.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of Government officials, the period is sometimes extended to four or five months, and even more. We make a special point to advance our cases as rapidly as possible.

Saving of Time.

In urgent cases for an immediate patent, persons can deposit the amount of the last fees with us, in San Francisco, and have our Washington agent procure the issue of the papers as soon as granted, saving the two or three months time which would otherwise be required for the inventor to receive notice and then forward the money. Money advanced for this purpose will be returned, should the application be rejected. By adopting this course, we are enabled, with our other advantages, to secure the receipt of patent papers to inventors on this Coast, at least four or five months sooner than can be done through agents in the East, without the applicant going to the hazardous expense of sending on the last fee before it is known whether the patent will be granted.

Expense of Applying for Patent.

The Government fee, on filing an application for a patent in the United States, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian, Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our citizens. The only discrimination made is against subjects of governments that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added fees for preparing the various documents and expense of drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, varies from \$20 to \$40. Following is the list of Government fees:

On every caveat.....	\$10
On every application for a patent, for seventeen years.....	15
On every application for a design, for 3 years and 6 mos.....	15
On every application for a design, for seven years.....	10
On every application for a design, for fourteen years.....	30
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Examiners-in-Chief.....	10
On appeal to the Commissioner from Examiners-in-Chief.....	20
On every appeal to the Judges of Circuit Court, D. C.....	25

Caveats.

A caveat is a description of the invention designed to be patented, lodged in the Patent Office before the patent is applied for, and while the inventor is perfecting his design. When properly made, it operates as a bar to applications respecting the same invention from any other quarter; but when improperly done, it is inoperative by reason of such defect. The Patent Office always returns a receipt for caveat papers with a copy of the laws governing the same, but does not seek to point out its incorrectness, unless there be some glaring defect.

If worth filing at all, these cases should be prepared with very great care and caution.

One inventor on this Coast, who had filed a caveat by an attorney, was, sometime afterward, surprised to find that his invention, which was a very important one, had been patented and was being brought out by an eastern company with a capital of more than a million of dollars. Upon inquiring at the Patent Office, he was informed that his caveat was inoperative by reason of imperfections and his not having complied with the law in that case as made and provided.

Our fee for the service varies from \$10 to \$20. The Government fee, under the new law, is reduced to ten dollars. This latter sum does not now apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftentimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat papers, we only require a sketch and description of the invention; no model being necessary.

If an inventor publicly uses and sells his invention, prior to making application for a patent, he cannot, afterward, prevent others from doing the same thing; and should any party put the invention into use, before such application for a patent is made, they could continue to use the specific machine or composition of matter after the patent is issued to another. Filing a caveat does not give the right to affix the words, "Patented," or "Patent applied for."

Patent Rejections.

First. Refusals are always made by the Patent Office if there is any informality in the specification, or if it does not contain the entire subject matter of the invention, and is not properly arranged and stumped. A slight omission often proves fatal.

Second. If the drawings are defective, and are not executed in an artistic manner in India ink, and on sheets of the required size, they are subject to rejection.

Third. Applications are always rejected where the claims conflict with others already patented. If the rejection should be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case.

For the prosecution of such cases, obtaining references, making arguments, and personally attending to explain the case (through our agent in Washington), we charge no second fee, as is the case with some agencies, but attend to the business till finally allowed or rejected, without extra charge, beyond the Government fee.

Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unsurpassed facilities in securing favorable results. We have been successful in securing Letters Patent in many such cases. Our terms are very moderate.

Advantages to Patrons of Our Agency.

Some of the advantages to be obtained by patronizing us, may be enumerated as follows:

1. Inventors on this Coast having their applications for patents made out through our agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated at New York or Washington.

2. As many of the inventions conceived here are especially adapted to the Pacific Coast, they should be properly brought out here, which can be accomplished (if the invention is a meritorious one) by illustrating the subject, with a careful description, in the columns of the "Mining and Scientific Press," free of charge; the inventor paying simply for the engraving, which will be executed at a moderate charge. The same cuts can be subsequently used for hooks, letters, or circulars. In a word, we are determined to make it of decided interest for every inventor on this Coast to patronize home talent and enterprise.

3. Most inventions on this Coast are for objects and purposes but little understood by parties at Washington or other parts of the East. Our mining machinery, processes and operations are best understood by those familiar with their use; and a personal, verbal explanation is oftentimes of important service, and enables us to be more successful than agents generally.

4. Remittances of money made by individual inventors to the Government sometimes miscarry, and it has frequently happened that applicants have not only lost their money, but their inventions, also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency. By sending duplicate correspondence to our Washington agent we avoid hazardous delays.

Dangers of Delay.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this Coast for the signature of the inventor, or by reason of return for amendment when addressed directly by the inventor to the Government.

Re-Issues.

When, through "inadvertence, accident, or mistake," an insufficient or defective patent has been issued, the defects in the Specification and Claims can be cured by a re-issue. In order to obtain this, the inventor, or the holders of the patent, must surrender the patent, and file an amended specification and drawings, and a statement specifying the ground for asking for a re-issue. Re-issues are generally applied for after it has been found that the patent could not withstand litigation. It is, therefore, especially desirable that the new Specification and Claims should be prepared with great care and skill. Terms liberal in these cases.

Foreign Patents.

In addition to American patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant patents, including Great Britain, France, Belgium, The Netherlands, Prussia, Austria, Russia, Spain, British India, Saxony, Hanover, Sardinia, Norway, Sweden, Australia, Mexico, Victoria, V. I.

Many valuable and important inventions of Americans are being yearly surreptitiously patented in foreign countries, some of which governments allow it, thus depriving those who have valuable inventions from their rights.

Patents obtained in England, France and Belgium, will secure the rights of an inventor among many millions of the most enlightened people on the globe; it is therefore very important, if the invention is valuable, to secure foreign patents.

Our schedule prices for obtaining foreign patents, in all cases, will be as low, or lower, than those of any other agency.

To Eastern Inventors.

Our close proximity to Mexico, Australia, and the Islands, enables us to obtain Letters Patent for you with much less delay and expense than they can be secured through any other agency in the United States.

Comparatively few inventors seem to be aware that Melbourne, in Australia, is a city nearly double in size to San Francisco, besides the adjacent colonies of great commercial and mineral importance. Inventions of all kinds, but especially those relating to the saving of gold and silver, if secured in Australia, will often prove of great value. We have competent agents there, and can promise that the business will be attended to with fidelity and dispatch.

DEWEY & CO.,

Patent Solicitors, Mining and Scientific Press Office,
505 Clay Street, San Francisco.

WORDS FOR MINERS.—The Gold Hill Daily News, Nevada—a medium of good authority—saith thus:

The MINING AND SCIENTIFIC PRESS is a weekly journal, published in San Francisco, which is entitled to the subscription patronage of every practical miner in Nevada, and every person interested in Nevada or California mining operations. It is a well gotten up sixteen-page quarto; and its reading would tend vastly to the particular "posting" and general enlightenment of our sort of working folks. Subscribe for it. Five dollars a year; three dollars for six months. It should have an agency in Virginia and Gold Hill; but we see none advertised in its columns. Every new improvement in mining implements and operations are fully described by words and illustrated by wood cuts in this excellent publication. A specimen number can be seen at our office.

ESTABLISHED

[MAY, 1866.]

VOLUME THIRTEEN

—OF THE—

Mining and Scientific Press,
COMMENCING JULY, 1866.

DEWEY & CO., Publishers.

Issued every SATURDAY, at our Book and Job Printing Office, 505 Clay street, corner of Sansome, SAN FRANCISCO.

Terms in Advance:—One year, \$5; Six months, \$3; Single copies, 15 cents; Monthly Series, \$5.50 per year, or 65 cents per number. Back Volumes from January, 1864, \$3 per volume; bound, \$5 per volume.

The MINING AND SCIENTIFIC PRESS is now thoroughly established, and enjoys one of the largest and most permanent subscription lists of any weekly journal on this coast. The individual character and reputation of its constant patrons throughout the entire coast is one of the best recommendations of its merits and value as a medium of intelligent progress and prosperity.

DEWEY & CO., Proprietors,

Mining and Scientific Press Patent Agency, Newspaper Book and Job Printing Office, 505 Clay street, San Francisco.

[Amis] July 1, 1866.

New Mining Laws of California and Nevada.

We have just issued, in cheap edition, the new laws relating to mining and corporations in California and Nevada, passed in 1865-6. Some of these laws are of the highest importance to parties interested in the matter of locating and holding claims, and prospecting mines, in these States. Copies sent by mail. Price, 25 cents.

Address, DEWEY & CO., Patent Agents.
San Francisco, May 1st, 1866.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, Sept. 22d, 1866.

The Money Market since our last reference has been characterized by rather more ease in some quarters, and the deposit line in Bank shows a slight accumulation of available funds. In the open market, however, the same stringency prevailing for some time past still continues, and the demand for fair securities is very active at full rates— $1\frac{1}{2}$ to $2\frac{1}{2}$ per cent. per month. These quotations are governed, in most instances, by the character of the collateral offered. Mining stocks are not in favor as a basis of loans, and few or no negotiations can be made upon this class of securities even at a wide range from current market value. The depression of the Share Market for so long a time has been in no slight degree effected by the inability of operators to obtain facilities in Bank or upon the street.

We quote Gold Bars at previous figures—\$300@340. Silver Bars range from $1\frac{1}{2}$ to $1\frac{3}{4}$ per cent. We learn of a choice lot selling at $1\frac{1}{2}$ per cent. discount.

Currency Drafts on the East sell at $3\frac{1}{2}$ per cent. premium on gold; and Coin Drafts are made at $2\frac{1}{2}$ per cent.

Telegraphic Transfers are made at $3\frac{1}{2}$ per cent. premium. Sterling commands 49d. for 60 days' bills.

Our latest telegraphic advices from New York quote Gold at 145 $\frac{1}{2}$.

City Stocks remain inactive, and the Board note no sales during the past week. On the 19th instant the Trustees of the San Francisco and Oakland R. R. Company sold at auction 400 shares of their stock within a range of \$51@55 per share. The capital stock of this company is \$500,000, composed of 5,000 shares at \$100 per share—full paid. California Steam Navigation Company is held at \$74 bid. State Telegraph can be obtained at \$31 $\frac{1}{2}$. Spring Valley Water Company is quoted at \$64 asked. San Francisco Gas Company is now held at \$130 bid.

Legal Tender Notes were quite active during the week just closed, and nearly \$100,000 were sold, opening at $71\frac{1}{2}$ ¢, steadily improving to 72, and selling yesterday at $71\frac{1}{2}$ ¢. U. S. 7-30 Bonds, July issue, sold at $75\frac{1}{2}$ ¢.

The Mining Share Market for the past week exhibits no improvement from the closing quotations of last week, and a reduced number of shares of the several companies have been dealt in. Yellow Jacket attracted the most attention, the same shares repeatedly changing hands during the various sessions of the Board. Several leading stocks have been well maintained, and the depression sometimes apparent after the payment of dividends is now quite noticeable.

Hale & Norcross continues to be firmly held, and for several weeks past no sales have transpired in the Board. At the close we quote it at \$1,680 bid. This mine, we learn, is in an excellent producing condition, and up to the 17th instant, some 1,900 tons of ore have been delivered to Custom Mills, 65 per cent. of the assay value of which gives a yield of about \$92,000, equal to a fraction over \$48 per ton.

Savage has met with few sales, declining from \$1,145 to \$1,120, rallying to \$1,140, dropping to \$1,105, and closing yesterday at \$1,100. This mine presents no unfavorable features. In the north Potosi chimney, 4th station, the deposit of ore, in running south, has widened and is of a better quality. Some improvement has been met with in the west seam, same station. On the 17th instant—in the south drift of the Curtis shaft—the connection between this mine and the Hale & Norcross ground was effected. It developed nothing of importance, and for the present only serves for ventilation, proving of considerable advantage in this respect. During

the week ending 15th instant, 441 tons of ore were extracted from the mine the approximate value of which is about \$19,845, and the expense of producing and reduction \$12,738, leaving a net profit of \$7,107. This company now employ 139 persons.

Crown Point is quite inactive, and trifling sales were made during the past week, opening at \$890, improving to \$915, buyer 30, then declining to \$875, and closing yesterday at \$825 bid. We learn of some improvement in this mine, and the lower drift, it is said, is looking much better. During the week ending September 16th, 652 tons of ore have been produced.

Yellow Jacket has been very actively dealt in, some 300 feet having changed hands during the week. It opened at \$735, ex-dividend, advanced to \$750@765, buyer 30, then fell to \$705, seller 10, and closed yesterday at \$685. From the 1st to the 16th inst. 20 $\frac{1}{2}$ tons of first-class and 4,025 tons of second-class ore have been extracted from the mine, yielding about \$118,800 from partial returns, or an average of nearly \$30 per ton. The average yield of the present month will, it is thought, fully equal that of August. This company now employ 135 miners, 23 carmen, 37 prospectors, 21 mechanics, and 22 outside men—total 243.

Gould & Curry has not been inquired for during the past week; two feet sold yesterday at \$600. We have learned nothing unfavorable in regard to this mine.

Ophir has been sold at a decline from former quotations, opening at \$210, advancing to \$212 $\frac{1}{2}$, receding to \$205, then selling at \$180, seller 30, and at the close sold at \$200. The work of sinking the shaft to a further depth of 100 feet, is being vigorously prosecuted, and is now down about 20 feet below the ninth station. The shipments of low grade ores, for the week ending September 12th, amounted to 186 tons, the average assay being 55 per cent; and of first-class ore for the fortnight ending September 15th, 37 tons at an average of about \$350 per ton, making an aggregate yield of \$22,250.

Chollar-Potosi declined from \$137.50 to \$130, rallied to \$135, then dropped to \$118, closing yesterday at \$115. We are informed of a slight improvement in several stations of this mine—nothing amounting to anything special. Some 460 tons of ore were shipped to custom mills during the week ending Sept. 15th. This company at present employ 85 men.

Belcher has also declined, opening at \$125@126, receding to \$122.50, then advancing to \$126 b. 30, and selling yesterday at \$115 b. 30.

Empire Mill and Mining Company was sold for \$77.50 early in the week, and we quote it at the close at \$65 bid. The receipts of this company are said to be in excess of the usual returns. We can learn of nothing to justify the recent decline of this stock.

Imperial has not been well maintained, opening at \$92 and closing at \$84. Since our last issue about \$16,000 in bullion have been received. The new shaft—known as the Imperial-Empire shaft—has attained a depth of 575 feet.

Confidence has declined from \$55 to \$47 seller 30, and sold yesterday at \$94. Bullion sold at \$20@19. Overman receded from \$9 to \$5 $\frac{1}{2}$, closing at \$4 50@4. Sierra Nevada sold at \$5@5 $\frac{1}{2}$, and Exchequer at \$1@75¢.

The aggregate sales of stocks, Legal Tender Notes, etc., since Saturday amounted to \$381,995.50.

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Continued Subscriptions.

For the reason that it is not always practicable to have our agent call upon subscribers for a renewal of their subscriptions as soon as their terms expire, we shall, when requested, continue to send the paper until our Collector calls around. This will only apply to old subscribers in the State of California, whose residences are within our regular canvassing routes. If the subscription is not promptly paid when the Canvassing Agent calls, the paper will be immediately stopped, and the bill left with the postmaster or express agent for collection.

It is not our intention to send the paper beyond the time desired by any subscriber, and should we accidentally or inadvertently do so, we shall expect the subscriber to send us written notice to discontinue.

By Law any person taking a paper from the post office is liable for payment. The Courts have decided that removing without giving notice to the publisher, and leaving the paper uncollected for, is *prima facie* evidence of intentional fraud on the part of a subscriber.

No new subscriptions or renewals received without payment in advance. August 1, 1866.

Mining Summary.

CALIFORNIA.

Alpine County—

From the *Miner*, of Sept. 15th, we clip the following items: The American company, in sinking an incline for the purpose of ventilating the works below, this week struck another body of quartz, the hack ledge from the croppings of which such good assays were obtained some time since. As soon as the air-shaft connects with it, the tunnel below will be pushed through this ledge. . . . The Mullan shaft is now down one hundred and twelve feet, and the quartz now found is of better character than at any point above. They intend to push on to the water level, where it is thought pay ore will be found in large quantities. . . . Mr. D. G. Wilson, who went east about a year since to secure capital to develop the mining property lying across Monitor Mountain, and known as the Turkish ground, has disposed of the property to a company of capitalists in Schenectady, New York. The tunnel, which is now in 100 feet, is to be pushed to completion as rapidly as possible.

Anador County—

The *Ledger*, of same date, says: Considerable quartz mining is going on about Aqueduct City, once known for its rich placer mines. The Bowers have two or three lodes, specimens from one of which we have seen. They were rich in free gold. John Ross & Co. have a large lode, which they call the Mammoth, and which has yielded \$40 per ton, working process. . . . Gen. Rosecrans and others have been visiting the quartz veins about Jackson during the past week.

Butte County—

The *Chico Courier*, of the 15th inst., says: Capt. DeHaven, of Susanville, paid a flying visit to Chico this week. He informed us that a rich gold ledge had been opened at Indian Valley, which was four feet wide at a depth of twenty feet, and showed gold throughout the rock. The indications are that it is richer than the famed Crescent Mills ledge. . . . John C. Nave writes to Mr. Jones, of the firm of Suydam & Jones, that he found a nugget of gold in his claim on the west branch of Butte Creek, known as Portuguese Point, the 18th of August, which weighed fourteen ounces, six dollars and twenty-five cents.

The *Record* says: We hear good accounts from operations on the Yuba and on the upper Feather. J. M. Clark & Co. have run a dam in White Rock, and are now taking out fifty dollars per day to the hand. They have plenty of pay dirt to keep them busy until the close of the season, and will realize more than any who engaged in the heavy fluming operations of former years.

Calaveras County—

The *Copperopolis Courier* of September 8th has the following items: Mr. Irvine, proprietor of the lately discovered valuable quartz lead at El Dorado, in this county, has all the machinery necessary for the erection of a mill on the claim, which he will soon have in operation. . . . A party of Mexicans have discovered a quartz vein four feet wide, at French Camp, about three miles east of Murphy's, from which they took out in one week, recently, twenty-six ounces of gold. . . . During the past week, the Gold Hunter company have made another very rich strike at a much greater depth in the shaft than that of the previous week, and also much richer.

Same paper of 15th says: The Angels' Quartz mining, or Southwell company, are about to erect a 30-stamp quartz mill on their claim at Angels, which is to be completed by the first of November next. Baker & Co. are also repairing their old mill, which will be in operation about October 1st. Angels now presents a livelier appearance than it has before for several years. . . . At the north end of the lower level in the discovery shaft of the Keystone mine, the vein is improving, and is now better defined than at any other point. . . . Prospects in the Empire are flattering. . . . Work will soon be resumed on the Columbus. . . . The Gold Hunter begins to talk about a 20-stamp mill. . . . A West Point correspondent of the *Calaveras Chronicle* records the discovery near that place, by Mr. Harris, of a quartz lode, which at the depth of six feet is four feet wide, and appears to be a solid mass of gold-bearing sulphurets. A streak four inches wide, near the hanging wall, prospects \$125 per ton.

The *Chronicle* of the 15th instant says: We understand that arrangements have been made by parties in this town for building a new quartz mill in the vicinity of Railroad Flat. It is to be devoted to custom work, and is to be supplied with one of the Tyler water wheels.

Colusa County—

The *Sun* of the 13th September has the following: We neglected to note last week the departure from town of the copper smelting apparatus for the Ashton mines. The company have heretofore sent out a large number of fire-bricks and have burned a kiln out there, and last week the balance went out, and

we expect soon to hear of practical results. They expect to get the ore from a lode near d'Arteney's, called the Lion. There is ore enough in sight to pay the very great outlay the company have made.

Contra Costa County—

The *Gazette* of September 15th says: Mr. John Tonkin, who has for some time been sinking in the neighborhood of Marsh Ranch for coal, struck a fine vein last week, in a shaft of thirty feet in depth. The coal is reported to be of excellent quality, and the vein is three and a half feet wide where the shaft intersects it. We also learn that several promising coal veins have been lately found in the San Pablo Creek hills.

El Dorado County—

The *Placerville Record* of September 15th says: The wealth of our quartz lead has long been problematical, but gradually actual working tests are demonstrating that we have rich paying ledges at our very doors. For instance, the Harmon mine has been worked but a short time. Last week the mill on this mine, after a run of eleven days, cleaned up 103 ounces of gold, making a bar worth something over \$1,854.

Fresno County—

A lot of 17,022 pounds of smelted copper ore, from Chowchilla mine, was shipped on the steamer Julia, from Stockton, on Wednesday afternoon. The weight of one lamp was 3,975 pounds.

Humboldt County—

From the *Mattole* correspondence of the *Journal* we cull the following items: The Davis well is down 1,170 feet; the Jeffrey 850, with no more prospects than before reported. At the Pioneer Farm Well they keep their drill in motion, and were down, on Thursday, 256 feet. For the present this is the well showing superior indications of oil. . . . The Yosemite will soon go to work again. . . . The recent levy of an assessment on "unassessable" stock in the Union has caused much dissatisfaction among the shareholders.

Inyo County—

A letter from Owens' River to the *Aurora Times* says: The Slate, Russ, White Mountain, Inyo, Coso and Slab Range are all rich as far as prospected. The San Carlos are pushing their work ahead, and will soon have their mill ready to commence crushing.

Kern County—

We clip the following from the *Humboldt Courier* of September 15th: Howe & Oders are actively at work upon their mines, situated on Fortune Hill. They are keeping their 5-stamp mill constantly at work crushing their ore. The yield pays handsomely. . . . The Union, generally known as "Piper's Mill," will soon be at work. This is a fine 10-stamp mill; it is now at work on the Andy Johnson lode, which is yielding very rich rock. . . . Erskine & Taylor have purchased the Pioneer mill, and are now at work on the Uncle Ahe. . . . Very rich rock is being taken out of the Delphi mine, and Mr. Burdett will soon start the Loyola mill to work on it. . . . The rock from the Robinson continues good. It is worked by arastras. . . . We learn that extremely rich rock has been struck in the Megguire lode, Plute district. The Hope, in the same district, continues to grow larger and richer as the rock progresses on it.

The Robert R. Johnson lode in Long Tom district, near the famous Long Tom mine, has two shafts sunk upon the vein, one forty-two and the other thirty-four feet, about forty feet apart, and each disclose a ledge from eight to ten inches wide. The rock is extremely rich. The vein has been traced a considerable distance.

Mariposa County—

The *Gazette* of 15th inst., says: The Potts' mine, in Hunters' Valley about which there has been so much talk, has at last changed hands. A wealthy company at San Francisco now own it, but the amount paid for it we are not able to state.

Nevada County—

From the *Gazette* we clip the following items: The Assessor's notes show that the North Star company, Grass Valley, has sixteen stamps running, three engines and boilers, and in the last twelve months have crushed 7,000 tons of rock, which has averaged \$30 a ton. The number of men employed is one hundred and forty, and their receipts in the past year have amounted to \$210,000. The Rocky Bar company are running sixteen stamps, employ sixty men, and have crushed in the past seven or eight months 3,500 tons of rock, which has averaged \$28 a ton. The best paying mine which has yet furnished statistics is the Heuston Hill mine, the rock of which has averaged in the past year \$100 per ton. . . . A remarkably rich specimen was recently taken from the ledge recently opened on Diamond creek by Mr. Spring and others. A ton of such rock would contain a fortune. . . . Marselus & Maltman determined a few days since to erect a mill at the old Manzanita diggings. The work is already under way. The mill is to have fifteen stamps, of 750

pounds each, and will be propelled by a turbine wheel. It will probably be running by November. . . . The Eagle company got up steam for the first time on the 13th. They are on the California claim. The engine is of 80-horse power.

Same paper of 15th inst. says: We learn that the Chalk Bluff Blue Gravel Mining Company, incorporated in San Francisco, have their preliminary arrangements nearly completed, and will commence sinking for the blue lead next Monday. . . . The copper ledge at Bear Valley has been opened only in one place, and that at no great depth, but is about four feet in width, and several tests and assays give a yield of from twenty to thirty per cent.

The Star company started their mill last week. Prospects are good. They are at work on Star rock. . . . We learn that the owners of the Jim ledge are now hauling another lot of rock to the Star mill, which will commence crushing it in a week or two.

The Grass Valley *National* has these items: The Union Hill mill, after a few days' run, has just cleaned up three hundred and fifty ounces of gold. The Vanderbilt ledge is situated a short distance from the Lone mine. The claim was located about four months since, and is owned by C. M. Willard and others. This company have sunk a shaft forty feet deep, at which depth they find the ledge to be about eighteen inches thick. The ledge, generally, prospects well.

The editor has made a trip to Union Hill three miles east of Grass Valley. From his description of the mills there, we extract a few items: The Lucky mine has two tunnels, one 400, the other 200 feet in length. A drift 1,484 feet long, connects the two. Shaft 275 feet. The new 15-stamp mill will be running in about three weeks. About 5,600 tons of rock have been taken out during the year past. . . . The mill of the Cambridge company will be started in October. . . . The Andrews company will soon strike the ledge. . . . The Union Hill mill is working custom rock. . . . The mill of the Union company crushes 350 tons per week. The incline is near 205 feet in depth. Drifts are being run east and west from the bottom of the incline. This ledge averages three to four feet, and grows wider as the depth increases.

The *Transcript* of the 14th, says: The hoisting works on the new incline of the extension of the Italian ledge, started up a day or two since. The incline is nearly down to the ledge, and in a few days the company will commence getting out rock. . . . Mr. Pattee started below, yesterday, to get a 10-stamp mill for the California mine.

Same paper of 13th, has the following: A Chinese company have been working over the bed rock in a set of claims at Relief Hill, in this county. Last week they found a boulder weighing forty-five pounds, from which they took thirty-four pounds of pure gold. This netted them the neat little sum of \$6,936, as the gold was sold for seventeen dollars per ounce.

EXCELSIOR.—The *Gazette* of 17th, says: We learn from parties recently down from Meadow Lake, that the 20-stamp mill of the Excelsior company is nearly completed, and the owners expect to start it up the first of this week. The company already have out a large amount of choice ore.

A correspondent writing from Meadow Lake, September 7th, to the *Grass Valley Union*, says quite a number of business men are packing up and removing their stocks to milder quarters. Appearances indicate that in the course of two or three weeks, Meadow Lake will be deserted by all its transient population. Business houses which have rented for \$100 to \$250 a month, are now offered free to the occupants if they will take them.

We clip the following items from the *Sun*: The North Star company have sunk a shaft some twenty-five feet deep on their ledge, and have discovered a fine vein of rich sulphurets ore. . . . The U. S. Grant company has purchased the mill of Parsons & Co., at Carleton, and are now engaged in making some alterations. . . . The Young American ledge is located about a quarter of a mile from Mendoza. The company have sent a small quantity of rock to San Francisco to the Swansea agent, and have the returns as follows: Gold, \$10; silver, \$15; cobalt and nickel, \$40; a large quantity of arsenic and other base metals. They receive in advance forty dollars per ton, and the remainder of the sixty-five dollars when the returns come from England.

Forty-six tons of ore from the Enterprise mine were worked at the Winton mill by batteries and copper plates. Four tons were crushed, and the pulp from the batteries was worked by the chlorinating process. The sulphurets of the forty-six tons were concentrated, and the ore, amounting in all to four and three-fourths tons, was subject to the same process. The net results are then as follows: Free gold, from forty-six tons, \$408; gold from raw ore, \$153; gold from concentrated ore, \$649. Total, from fifty tons, \$1,210.

Placer County—

The *Herald* of Sept. 15th, has these items: Mathewson & Neely have recently struck a quartz lead, on the ridge between and near the junction of Rock and Dry Creeks, of about twelve inches in width, that is turning out rock showing an abundance of free gold. . . . The New Hope company located their claim on the 2d day of August. Their shaft is now down 19 feet, out of which they took 25 tons of quartz, which was crushed at Pugh's mill in Ophir. The rock yielded \$7.50 to the ton. The claim is located about one mile and a quarter south of Auburn. . . . On the Wells quartz claim, recent developments have been very flattering. The lead is between three and four feet in width, showing a strata of partially decomposed quartz, 12 inches wide, rich in free gold; a strata of copper sulphurets, and also one of gray sulphurets, in which free gold is plentifully distributed.

The *Stars and Stripes*, of 12th, says: The owners of the "Civil Rights," a few days since, commenced sinking on a parallel ledge to the former, and at the depth of thirty feet have struck a vein fourteen inches wide, which prospects well in free gold.

Plumas County—

The following items are from the *Quincy Union*, of the 15th inst.: A company of citizens from this town have located 24 claims of 200 feet square each, on the flat at Elizabeth-town. They intend purchasing a steam engine and pump, and will then sink a shaft to the bed-rock and work the claims by drifting. . . . We learn that White & Co's claim, near Nelson Point, filled up with water one day this week, and the pumps now in use are not able to drain the ground again. The company had just struck bed rock. . . . King's Quartz mill, at Mohawk Valley, was cleaned for the first time on Saturday last. The amount taken out was \$600, which was from the aprons alone, the batteries remaining undisturbed. . . . Mr. C. W. Callahan, who has been at work prospecting upon his ledge, near the Crescent Mills, for the past two years, has at last struck some very rich rock.

We learn from the *Appeal* that an old friend of ours, of the Mount Hope company, eight miles above La Porte, has "struck it." The company have a tunnel into a hill 2,300 feet, and are now beginning to reap the reward of their persevering labor. They are working ten hands, and taking out four and five dollars to the hand per day. After getting in through a great deal of waste dirt, which is now necessary to remove, they expect to average nine dollars to the hand.

Shasta County—

The *Courier* of the 15th inst. has these items: The Williams & Kellinger Company have decided to abandon all work on their upper tunnel, and have also stopped running the lower tunnel in the direction in which it has been run for 1,035 feet. A vein of ore was tapped and passed in the lower tunnel in June last, at a distance of 950 feet from its mouth. They will return to that point, and drift each way for the main ledge. . . . The Potosi are now running their mill, pushing their tunnel ahead, and sinking a shaft on the ledge, all at the same time. This week they cleaned up after a run of eight days, and realized the sum of \$978.98. . . . Kelly's new mill at Muletown is now running, and we will probably be able to give the result next week. The rock is said to assay remarkably rich in gold and silver, and the owners think it will eclipse the Potosi ore in value. The latter pays from \$75 to \$100 per ton. . . . Rock from the Chicago looks fine. . . . The Horse Shoe Bnd Co. will not commence operations on their claim this fall.

Sierra County—

The following items are from the *Messenger* of the 15th inst.: A clean up of twenty tons of the rock from the Good Hope, at the Gold Bluff mill, yielded thirty dollars to the ton. . . . Stockwell & Sayles, mining in Kanaka Creek, at the mouth of French Ravine, took out eleven hundred dollars last week. They had been doing well for some time previous. . . . The Pittsburgh Mining Company of Potosi, have again struck pay dirt, and last week took out \$4,000. . . . Governor Newell, of the Greenback ledge, is still pushing forward his mill as fast as men and money can do it. . . . The Spoon ledge, at Chips' Flat, are pushing forward a tunnel toward their ledge, with fair prospects of striking it within seventy-five or one hundred feet. The croppings paid well in a hand mortar.

Same says of the Bear Valley mines:—Two assays were made from the top rock of the Bear Valley Company's ledge which assayed forty-two and forty-seven dollars gold and silver. The Hamilton Company, Murray ledge, has run a long open cut to strike their ledge. They have taken out some very fine looking rock. The Sherman ledge, Sheridan Company, have stripped their ledge across, and are sinking down. The Wilho Company is down on their ledge about nine feet. The Rickleton ledge, about eighteen feet wide, is very much impregnated with sulphurets. The Florence Company are down on their ledge eight feet. The Virginia Company has stripped their ledge across preparatory to sinking a shaft down fifty feet.

Yuba County—

The *Appeal* of Sept. 18th says:—A correspondent sends us the following items from Brown's Valley: The Jefferson Company is getting up its new engine, boilers, etc., and expect to get the pump running in about a week. This is impor-

tant because the mine is filling with water. The Pennsylvania is crushing with its little battery, and doing as well as ever. The fortnight's clean up on Sunday was about the same as the last—say \$3,000. The Rattlesnake stopped work on Saturday, and there was considerable excitement because there was no money on hand to pay off the workmen. Probably work will be resumed again.

Correspondent of same at Smartsville, gives an account of the claim on the "Ancient River, or Blue Gravel Beds." We select a few items:—The Babb Company cleaned up after a twenty days run, at the rate of \$500 per day. James O'Brien has 200 feet of his tunnel completed. The Pittsburg and Yuba River claim will soon be washing. The shaft shows the finest prospect. It is thought it will be a second "Blue Gravel" claim. The flumes of the Blue Gravel are 3,000 feet long. They make about eight runs per year. The yield, as the figures given show, varies from \$3,000 to \$50,000 for each run. The claim has yielded \$600,000.

NEVADA.

Washoe—

The *Enterprise* has these items: The Savage continues to yield well, and the stock stands at good figures. One hundred thousand dollars is said to have been about the actual profits of the mine for the month of August. Drifting south from the Curtis shaft, unprofitable spots of ore are encountered in the ledge, but the good bodies of ore found in the other parts of the mine are what tells the story. A connection will soon be established between this mine and the Hale & Norcross, to the mutual benefit of each, in the way of a free circulation of pure fresh air. Operations in the Eschequer mine have ceased entirely for the present. Some day or other, when perhaps money is more plentiful and assessments come in freely, it may again be worked, and so successfully as to prove it at a greater depth to be like the Hale & Norcross.

The Yellow Jacket company, at Gold Hill, are now putting up a new engine of 60-horse power at their old works, for hoisting ore, keeping the old one for running the pumps.

Reese River—

From the *Rebelle* we clip the following items: The claim of the Cortez company, on the famous Nevada Giant, in Cortez district, is being worked at present with some degree of energy, and they have taken out about 200 tons of ore which will yield probably an average of eighty dollars per ton. The stratum in the vein from which it is procured is represented to be twelve feet thick, and its extraction resembles quarrying rather than ordinary mining. At present the ore is packed on mules seven miles to the mill, but it is only necessary to pack it about 300 yards. The mill is running, and there are about forty men employed in the district. We saw, yesterday, some specimens of remarkably rich ore from the Hot Creek district. They were obtained from a ledge called the Keystone, recently discovered there by J. J. Noon, and contains masses of native and horn silver. A boiler, engine, and hoisting apparatus, for the Rough Diamond company, had arrived. The crude bullion brought in from the Philadelphia district by Colonel Buell, has yielded beyond the expectations of the most sanguine. The bullion weighed 3,855 ounces, which, after being melted, yielded four bars valued at \$3,648.09. This was obtained from fourteen tons of ore, which was crushed wet and treated without roasting, and yielded an average of over \$260 per ton. It has been estimated that the cost of working the ore from the High Bridge, including the expense of mining and transportation, will not exceed twenty-two dollars per ton. Four and a half tons of ore from the Detroit ledge in the Northumberland district, reduced at the Keystone mill, produced a bar of bullion of the value of \$569.30, an average yield of about \$126 per ton. The ore was obtained from the surface. We are informed that greatly superior ore is being taken from the lower excavations in the Murphy mine, in the Twin River district, and that good ore has been accumulated to the extent of a thousand tons. The mill of the company will be completed and running about the first of October. A portion of the machinery for the hoisting works of the Stranger mine, on Lander Hill, had arrived.

Two bars of bullion, 387 and 383 fine, and valued at \$1,865, were obtained from seventeen tons of first and second-class ore from the Morgan and Muacney mine. The ore was reduced at the Keystone mill, and yielded at the rate of \$110 per ton. Work has been resumed on the mines of the Manhattan company. The fine property of the company has been closed for several weeks, for reasons which appear wholly inexplicable. The mill is being overhauled, and put in a condition for successful working.

From "Notes of a Prospector" in same paper, we call the following in reference to ledges in Northumberland district: The Lady Cummings was located on July 12th, and comprises 1,000 feet. It crops boldly for about sixty feet, has been increased for a considerable distance and shows splendidly, width, four feet. A load of ore is to be sent to Austin for reduction. Operations has been commenced on

the Northumberland. The Riehe and Hussey, near the Northumberland, is producing exceedingly rich rock. The Detroit No. 2 is two miles south of the last named. The indications give promise of splendid results. Four and a half tons of surface ore were shipped to Austin, and worked at the Keystone mill, producing a bar of silver of the value of \$569.30. The Central is large and promising. The Armadillo is a small but very rich vein.

The same has an editorial predicting an excitement in reference to that region, when the extraordinary value of the discoveries made during the past year becomes known and appreciated.

The Nye County *News* of Sept. 8th, has the following: In the Knickerbocker, a new tunnel is now in ninety-four feet, and will probably reach the ledge during the present week. Work is being vigorously pushed on the lower or main tunnel, which is in some 240 feet. Mr. Hamilton has arrived in Mammoth district, and will at once commence the development of a portion of the ledge belonging to the company recently organized in Philadelphia, under the name of the Hamilton Co. *Emeralda*—

The *Union* of Sept. 15th, says: The work of the Philadelphia company is progressing well and favorably under the circumstances. The large flow of water had reached the depth of 220 feet, and was being pushed ahead as rapidly as three sets of hauls could sink it.

Black Rock—

The *Eastern Slope*, published at Washoe City, Nevada, says of this district: From a friend who has just returned from the wilderness we gather some items from this region. He says as far as quantity is concerned, no such deposit of minerals was ever discovered before. The ledges are plainly defined, of easy access and are magnificent in their extent. As to their richness there can not now be any more doubt. Dall's mill has worked ore from some twenty different ledges, and without exception, with good results. The Evans Brothers, of Long Valley, are building a mill near Hardin City. It will probably be in running order by Oct. 1st. The *Sage Brush* of the 25th Aug., says: Two of the Black Rock companies have this week made sale of 500 feet of Snow Storm ledge, Hardin district, for \$20 per foot. The purchasers are men of capital, and design the erection and permanent establishment of a mill in this district immediately. The price offered and accepted by the parties for the ground, was only in consideration of benefits derivable from opening up and prospecting the country by means of a mill.

OREGON.

This Oregon Mammoth, one of the newly-discovered quartz ledges on Powder River, is reported by an Auburn correspondent to be very rich. Great excitement is prevailing in Baker county over the discovery of quartz ledges about twenty miles from Auburn, on the head waters of Powder River. Not less than 10,000 feet had been claimed within a few days after the discovery. We learn, says the *Jacksonville Reporter*, that the new quartz mill of the Occidental company, on Jackson Creek, will be employed on or about the 20th of September, when they will commence crushing rock from the Davenport lead.

IDAHO.

We clip the following from the *Owyhee Avalanche* of Sept. 8th: It will be five weeks next Monday, at noon, since the Cosmos company took possession of the Silver Coud mine and commenced opening it. Two tunnels and two shafts were immediately commenced. The lower tunnel is in 270 feet from the beginning of the open cut; the upper one is in 110 feet. The upper shaft is down sixty-five feet; the lower one is at the mouth of the upper tunnel—twenty-eight feet. Another shaft is commenced at the mouth of the lower tunnel, to be sunk sixty feet as soon as possible, from which it is proposed to make another level. The ledge shows an average width of three feet—well defined and proven up for nearly 800 feet. The mill has been crushing rock from the mine for the past two weeks with satisfactory results. The bullion is worth an average of nearly \$6 per ounce. The Lincoln company are still prosecuting development on the Allison. Have been crushing ore from it recently. With what results we do not know, but believe the company have faith enough to continue to prospect it. The legal difficulties concerning the Jackson or Webfoot mill, have been adjusted and the suit withdrawn.

The editor has made a visit to the Poorman mine. He says: We have never been guilty of "pulling" any mine, and it would be entirely useless to do so in this instance; as but few men have ever seen anything near its equal in richness, and therefore receive true statements of it with incredulity. Work is suspended except on the original Poorman ground, and at present the condition of it is about this: Two shafts down respectively 104 and 114 feet—distance between, 129 feet. A tunnel

extends from the bottom of one shaft to that of the other, and the workmen are sloping upwards from this tunnel which has just been completed. The ledge proper will average eighteen inches. The wall rock to the depth of several inches is rich in gold and silver. This, added to the real ledge, makes an average pay vein of fully two feet. Every part of the ledge, opened as before described, contains very large quantities of pure gold and silver—the latter predominating. The "candle-box" and "wagon-tire" reports did not emanate from our pen, but we are willing to vouch for their truth. We picked up one piece of silver the other day, among the second class ore, that would go far towards making it a "buggy" tire, and saw solid chunks of silver as large as a gallon measure, and pure sulphurets of silver studded with free gold in much larger pieces. We could not find a piece of rock with any solidity that was not either full of free gold, or partitioned off with myriads of silver sheets, or made up of sulphurets of silver and free gold. It must not be inferred from these remarks that the whole ledge is of this character of ore—but we do mean to say that it contains tons of it, and that so far as human sagacity can force, will continue its present yield of pure metal. The decomposed quartz and vein matter is very rich in free gold, some of it yielding as high as forty dollars to the pan. Visitors to the Paris Exposition of 1867 will see sights of native metal that will substantiate all we have said, and New Yorkers will soon have the evidence in their city. We've made no attempt to more than generalize the nature and value of this mine.

In regard to the failure of Moore & Fogus, the public belief seems to be that it was owing to the dishonest management of the officers in charge of the mill and mine, which of themselves are paying institutions. The creditors representing indebtedness to this amount of \$200,000, are about negotiating a purchase of the Oro Fino and Morning Star ledges; also, the mill property. A short time before the failure, it had been reported that the property had been sold to an English company, through a New York banker, for one million of dollars. A letter to the *Marysville Appeal*, says the aforesaid company failed, however, to "come to time" on Sept. 1st.

Same paper of the 25th of August, says: Probably the richest mining claim in Idaho is situated at the head of Blue gulch, and is owned by Albert Young, J. Colehower and others. It consists of twelve hundred feet in length by forty feet in width, and is from twenty-two to thirty feet in depth—a washed gravel to the bed-rock. In many places as high as \$2.50 to the pan can be obtained; and a cent and upwards in even the poorest of it. Our informant washed out from one pan seventy-five cents, and the owners seemed disappointed at so small a result. They have sent on for hose, galvanized iron pipes, nozzles, etc., for a hydraulic, to be erected and ready for operation early next season.

The *World* of Sept. 1st, says that \$108,745 was the amount of gold dust shipped from the Pioneer office of Wells, Fargo & Co. in June, July and August.

The *Salesman* (Ada county) of the 4th says of the Yuba district in Altares county: The "Northern Mining Company" have their mill nearly ready to run: will start about the middle of this month with ten stamps. They are going to start on Empire and Leonora rock. A letter is published stating that placer diggings had been found on Green River. The writer thinks it will be a very extensive mining district, and will probably pay from \$8 to \$15 per day. It is forty miles north of Lander's road leading from the South Pass to Snake River, and one hundred and fifty miles east of Taylor's bridge on the Snake.

MONTANA.

The *Post* of 1st inst., says: We learn that Dr. Hopkins, at Bannack, is making astonishing developments on the Dacotah, which must now be one of the best gold bearing quartz lodes in Montana. Specimens of the rock have been left at this office. Quite an excitement has been created, recently, at Bannack, about the new discoveries on Salmon river, or Deadwood Basin, which is said to be about eighty miles from that place. Parties who represent that they have visited the new mines, say that the basin is about thirty miles long, varying in width from five to ten miles, and that gold has been found in all parts of it, and that five hundred men are now at work prospecting them.

The *Republican* of August 30th, has the following: At Farrar Brothers' mine, in New York gulch, \$530 were cleaned up on the 18th inst., from six tons of rock, taken from the lode known as Excelsior No. 2. Two new mills, one twelve, and the other of twenty-four stamps, had arrived for the St. Louis and Montana company.

COLORADO.

The *Denver News* of September 5th, has the following: We have received from Mr. E. L. Bright a specimen from the Union Lode, near Golden Gate. Mr. B. showed us a lump

of pure copper weighing five ounces, which he had smelted from one pound of the crude ore. The Nonpareil Mining Company, which owns property in that vicinity, received as the result of an assay from one of their lodes, sixty-five per cent. in copper.

The same says of the Snake River mines: The mountains all about the head of Snake River and its branches appear to be a perfect network of silver-bearing lodes, and this abruptness of these mountains are peculiarly adapted to an economical working of the lodes, as comparatively short tunnels must strike the lodes at a great depth from the surface. Wood and water are abundant. A very large number of assays of the ores from this district have been made, showing their immense richness. We trust that preparation will be made during the coming fall and winter for the erection of reducing works in the early spring.

UTAH.

The *Vedette* of September 13th says: We have received a call from Mr. W. Gibson, who is operating in the Stockton mines. He has erected a smelter with a capacity of 600 pounds a day. Nine runs have been made, of a hundred pounds each, and 300 pounds of metal were obtained. The result of an assay by Messrs. Bohm & Molitor is \$228 of silver to the ton, the remainder being nearly pure lead. This furnace is constructed with the fire-stone found at Stockton, and works admirably. The cost of the furnace was \$300. It requires three men to work it, and uses two cords of wood to the ton of ore, no coal being required. Ore is delivered at the furnace for one dollar per hundred, and wood for six dollars per cord. Mr. G. will immediately put up a cupel furnace, so that inside of twenty days he will be turning out silver bricks. General Connor's machinery will be at Stockton within a few weeks, and the large furnace which is being erected by Jas. Finnerty is rapidly approaching completion.

BRITISH COLUMBIA.

It was reported that gold quartz yielding \$3,286 to the ton had been discovered on McCulloch Creek, Big Bend. The miners at Big Bend assert that the dispatches in the parliamentary Blue Book, giving glowing accounts of the mines, are forgeries, because a gentleman in his position would not lend himself to such falsehood. The Nanaimo Coal company had 15,000 tons of coal on the bank, and no sale. Work in the collieries had been suspended.

MICHEL'S AMALGAMATOR.—This amalgamator, as it is called, is a pan designed for pulverizing gold and silver-bearing ores, and, at the same time, to amalgamate and save their precious metals. This pan is quite novel in its construction; in fact, it is so unlike anything else of the kind, that we feel utterly unable to describe it without an accompanying illustration. It has been the aim of the inventor to combine in one machine both a grinder and concentrator, and which, at the same time, shall be continuous in its operation. This Mr. Michel has endeavored to accomplish, according to our recollection of his plan, the drawings of which we saw some six months ago, by surrounding the pan with a kind of a circular trough, filled with still water, over which the pulp must flow in effecting the discharge of its surplus water. The design is to settle all heavy particles of sand or metal in the bottom of this trough, while the lighter and coarser particles flow to waste. It will be seen from the following paragraph, which we clip from the *Nevada Gazette*, that this pan has recently been subjected to a practical trial, in company with other pans, at this Allison Ranch mill, in Grass Valley:

A pan invented by Justin Michel, of this city, and now in operation at the Allison Ranch mill, it is believed, approaches nearer perfection, in this respect, than any other heretofore in use. Perhaps no man in California has had better opportunities for testing and judging the merits of the different inventions for separating and saving gold than Philip Galloway, superintendent of the Allison Ranch mine. Galloway, for some time past, has been engaged in a series of experiments with "Michel's Grinder, Amalgamator, and Separator Pan," and gives it as his opinion, after a thorough and impartial trial, that this is by far the best pan for working sulphurets or tailings that has yet been invented. He has had the advantage of being able to compare this pan with several others now in use in their mill, and he has found it superior to them all. Coming from the source they do, these statements are of significant importance to those whose interests are affected by the quantity of gold saved and quicksilver retained in the grinding process. A pan that would save only five per cent. more of the precious metals than its competitor, would be a great desideratum.

Mining and Scientific Press.

W. B. EWER, SENIOR EDITOR.

Canvassing Agents:

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. Thomas Starr is Agent for the MINING AND SCIENTIFIC PRESS in Nevada, and will canvass the principal cities, towns and districts of that State. August 25, 1866.

Mr. O. P. Truesdell will act as our Corresponding Agent and Solicitor in the interior of this State, from this date, August 25, 1866.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.

Mr. J. N. Hudson, is authorized to solicit subscriptions, advertising, etc., for the MINING AND SCIENTIFIC PRESS, in San Francisco, and to receipt for the same.

The Agency of Chas. A. Russell and Erwin Zimmerman, for this paper, ceases from this date. Sept. 8th, 1866.

SUBSCRIBERS who do not receive the MINING AND SCIENTIFIC PRESS in due time, are requested to inform the publishers.

San Francisco:

Saturday Morning, Sept. 22, 1866.

NOTICES TO CORRESPONDENTS.

OWING to the great and rapidly increasing amount of our correspondence, consisting largely of queries relating to various interesting points connected with Mining and Metallurgy, we find it indispensably necessary, for want of space, to confine our replies in future chiefly to a series of brief notices, which hereafter will appear regularly under the above caption.

X. Y.—Dry crushing, as described by those who have witnessed the recent trials of the resuscitated Ryerson process, at Bear Valley, is a very slow, tedious, and, consequently, expensive mode of reducing ores to a finely divided state. The advantage of dry over wet crushing ores, to be afterwards reduced or amalgamated in the manner described by the use of superheated steam, has not been fully established. The accounts of the trials at Bear Valley bear strong evidences of inflation, to use the mildest phrase. For instance, it is reported that one of the great aids towards the extraction of the gold is produced by using superheated steam, at a temperature sufficiently high to sublime mercury, say about 700°, the vapor of which is condensed at the top by an iron plate constantly kept cold by means of water; and when reduced to the liquid form, it is anticipated will descend by its gravity, and so amalgamate with any free gold which may be left. One great misfortune for this process must be that when the temperature of the vessel and contents is raised sufficiently high to sublime quicksilver, it parts from the amalgamated gold, leaving the latter in something like its primitive metallic form. Superheated steam, even at 800° or 900°, in a close vessel, will not desulphurize pyrites to the extent desired. Taking the above facts into consideration, and coupling with them the circumstance that the "Pine Tree," from which the ore is said to have been derived, does not assay, on an average, anything like thirty dollars per ton, we are inclined to suspect that the accounts given of the experiments you refer to are anything but impartial, and should be accepted, as they have been by us, "*cum grano salis*."

ENQUIRER, SHASTA.—The ore found in Montana and Idaho are very varied. The celebrated Candle-Box lead has primarily consisted of a mixed sulphuret of silver and antimony, which, by natural decomposition, has become partially converted into metallic silver. Other varieties are largely mixed with copper; amongst the richest of this class is one principally consisting of the red oxide of copper, intermixed with variable proportions of the sulphurets of copper and silver, and occasionally with gold also.

ONE WHO WANTS TO KNOW—HUMBOLDT. Lead in various forms, and in ores of different species, has from time immemorial been used to extract gold and silver from the most complex and difficult ores. There cannot, therefore, be anything new in the so-called "Lyon" process, unless the lead or its compounds are employed in a peculiar furnace, or in some particular manner. We understand, from Doctor Macgowan, that the Chinese procure their Sycee silver in this manner.

[Editorial Correspondence.]

THIRTEENTH ANNUAL STATE FAIR.

New entries were daily made at the Pavilion, up to the closing day of the exhibition, and the general interest manifested by the public increased from day to day during its entire continuance. The Fair was certainly a financial success, even though it might not have reached that character, as an exhibition, which its managers and friends desired to see it attain. The deficiencies, in the latter particular, were certainly in no wise attributable to the management; but must be charged exclusively to the indifference manifested on the part of those who should have availed themselves of the opportunities offered by the Society, to place their inventions and improvements, their manufactures and productions, before the public. Inferior, however, as was the general aggregate of display, it was gratifying to notice that the pioneers in all the most important industrial enterprises were there with the results of their enterprise and ingenuity.

Chief among the manufactures, was the display of Mr. W. H. Rector, of the Oakland Manufacturing Company, who made a fine exhibit of the first cotton manufacture ever turned out in the State. The mill of this company wove its first yard of goods on the first day of September last, since which time the works have been in constant and successful operation. Its capacity is about 30,000 yards of 4-4 sheeting per month. Of course the most of their raw material has to be purchased abroad; but they were enabled to exhibit several specimens of goods manufactured of California grown cotton. It was remarked by all observers, that the appearance of the goods made from home-grown cotton, was decidedly superior to the same fineness of goods manufactured from foreign material.

This company will soon add to their works the requisite woollen machinery for producing jeans, linseys, flannels, etc. They also afford a home market for all the cotton which can be grown, at the present time, on the Pacific coast. This was one of the most important and suggestive exhibitions at the Pavilion.

The above company also exhibited several bales of cotton twine of their own manufacture, which was pronounced fully equal, if not superior in evenness, strength and manner of wind, to any which can be imported. This may also be regarded as quite an important enterprise, from the fact that our market has for a long time been compelled to put up with quite an inferior article, furnished from abroad at an exorbitant price. The first premium was awarded to Mr. Rector, both for his woven cotton goods, and for his twine.

I. C. Mayer & Sons, of the Pacific Excelsior Mills, of this city, displayed six bales of cotton wadding and batting, of different varieties and qualities, manufactured from California cotton, which they are prepared to supply at cheaper rates than the same goods can be imported from the Eastern States. The quality of this batting was much admired and commented on by the ladies, especially, on account of its clean, neat and durable appearance. The imported batting is usually made chiefly from the waste of the Eastern factories, while this is made directly from the unselected cotton. The great superiority of the San Francisco batting was therefore most especially apparent to every one. The enterprise is an important one, and cannot fail to prove a pecuniary success. Samples of the new cotton, in the holls, from which both the woven goods and batting were made, were exhibited by the side of the goods themselves. The first premium was awarded for this exhibition.

Next, if not equal in importance to the cotton exhibit, was the elegant and suggestive display of L. Prevost, of San Jose. This exhibition consisted of a perfect epitome of silk culture, from the earliest stage of feeding the worms on the mulberry leaf, their gradual growth, forming the cocoon, hatching the eggs, the reeled silk, and, though somewhat late in the exhibition, a specimen of woven silk from California production. Mr. Prevost exhibited cocoons raised from eggs furnished by him, from

a great number of parties in various parts of the State.

The piece of silk exhibited was manufactured by Messrs. Meyer & Neumann, who are just establishing a silk factory in this city. It is the first piece of silk manufactured in this State; and is a little over one yard in width, and about a yard in length. It is of the kind of goods known as "rep," and designed for ladies' dresses. It is, moreover, the first piece of this kind of goods ever made in the United States.

Too much credit cannot be given to Mr. Prevost, for the interest which he has taken in introducing this branch of industry into California. He has been indefatigable in his exertions, not for his own private gain, but often in direct conflict therewith. He is really doing the work of a philanthropist, and has entered upon it with a degree of enthusiasm and self abnegation, which will indissolubly connect his name with the establishment of a business on this coast, which bids fair at no distant day to flourish in greater perfection, and to assume a magnitude unsurpassed by any other locality on the globe, engaged in this branch of business. A special premium was awarded to both Mr. Prevost and to Messrs. Neumann & Meyer.

Among the new inventions exhibited, was the grinding and amalgamating pan, by Mr. J. S. Crall, which was fully alluded to last week.

Next, perhaps, in importance, was the Reversible Side-Hill Plow, invented and exhibited by Mr. John Mott, of Danville, Contra Costa county. This plow was illustrated in our issue of July 21st. It attracted much attention from those interested in agricultural pursuits, and fully sustained all that is claimed for it in a practical trial, to which it was subjected before the appropriate committee. We have repeatedly described the principle and working of this plow. Suffice it now to say, that it is fast winning its way into universal use, not only for side-hill work, but also for ordinary level ground plowing. The conception of this improvement is the result of much study and cost of time and labor on the part of the inventor, who is a practical adept at this important implement, the thorough and accurate working of which is the foundation of all agricultural success. Two first premiums were awarded to Mr. Mott; one for the best stable plow, and the other for the best side-hill plow.

Messrs. Hill & Naught, of Marysville, exhibited their newly-invented Broad-Cast Grain Sowing Machine, with revolving harrow attached. This machine was fully described and illustrated in our issue of the 8th inst.; but no description can give anything like such an accurate idea of its workings as a personal examination of the machine itself. We noticed that the machine attracted much attention from those interested; and all, so far as we could learn, expressed the utmost confidence in its capability to perform its work in quite as rapid and effective a manner as is claimed for it. The great difficulty with broad-cast sowing machines, is to make them do their work evenly, and at the same time be made adjustable to the different sizes and variety of seed. A glance at the construction and method of its operation will readily convince any practical man that this machine can do all that is claimed for it. It is readily adjustable for any sized seed, from a mustard seed to the largest grain; and the stirers are so arranged as to render an even distribution of the same over the ground a moral certainty. No opportunity is allowed for packing. The first premium was awarded to this machine.

Rudolph & Braun exhibited a new gun-lock, of their own invention, which attracted no little attention from all interested in firearms. The great advantage of this gun-lock over all others, grows out of the fact that while it is equally as strong and effective, it only occupies about half the depth of wood of any other. The construction of the locks now in use require so much cutting away of the wood as to render the gun-stock extremely weak. It will be recollected that, gun-stocks always break at the very place where the locks are set in, because that is necessarily the weakest point. Some idea of the superiority of this lock may be inferred from the fact that a double-barrel gun, fitted with two of these locks, has fully three times the thickness of wood at the weakest point, which the same gun would have fitted with the ordinary lock. The inventor, while in Washington, recently submitted

his invention to the Chief Examiner of United States Ordnance, and other parties interested officially and otherwise in military equipments, all of whom expressed themselves highly gratified with his invention, and assured him that it would most assuredly be introduced into all firearms hereafter manufactured for government use. The advantage of such an improvement, in time of war, can scarcely be estimated, considering the rough usage necessarily attendant upon firearms, either in camp, on the march or in battle. As a piece of mechanical skill, it takes front rank for utility. It gives fully double the ordinary strength to the gun at its weakest point, while not a particle of the efficiency of the old gun is lost by the application of this new invention. It is no more likely, and if anything less liable, to get out of order than the lock ordinarily in use. Our readers will not be surprised that it was awarded a special premium. Perhaps it may not be out of place here, to state that each and all of these important inventions have been patented through the MINING AND SCIENTIFIC PRESS PATENT AGENCY.

THE EXCELSIOR AMALGAMATOR.—We don't know of any better or more appropriate name by which to designate the new amalgamator recently invented by Messrs. Sennitz & Knowlton, of Sacramento. It is a gold-saving machine, which we have already alluded to, and a working model of which we examined while in Sacramento last week. This machine is the result of much thought and experiment, and is quite a novelty in the way of gold-saving machinery. It consists essentially of two or more shaking tables, placed in a line endways, one above the other, like broad stairs. The tables are long boxes, with each end turned up and bent inwards, like the toe of a skate. The sand is fed into one end of the uppermost one, passes gradually, with a shaking motion, to the opposite extremity, at which place it is discharged through a circular opening about an inch and a half above the bottom, into the next table below, and so on to the second and third, if desired; although the experiments thus far render it very conclusive that but two tables will be needed in actual practice. The tables are covered with a stationary covering, to the underside of which is attached a network of projecting teeth or rifles, the same being arranged in pairs, each pair representing a common staple, with square instead of round corners. These stationary teeth project downward so as to just clear the bottom of the pan or table, and as the latter works backward and forward, with a sliding motion, while the former are stationary, the result is not only to prevent the sand from packing, but also to keep it in such a constant state of agitation as to repeatedly bring every particle of the same, with its golden contents, into intimate contact with the quicksilver.

A great number of experiments on refuse tailings, which have passed through the best pans, amalgamators and settlers in use, we are informed, have yielded up a very considerable amount of gold to the searching action of this new machine. The results which have been shown us, as obtained from the model machine, are really astonishing. This machine has the merit of not conflicting with any of the pans now in use, as it is used neither as a triturator nor separator of sulphurets; although, if it works as well in extensive practice, as the working of the model would seem to indicate that it will, it must avoid all necessity for settlers. The quartz must be ground, as usual, in pans, and the sulphurets collected by a concentrator, after both of which this amalgamator should be used.

A large machine was put in operation the first of last week at the Golden Rule mill in Placer county, and the report of its first clean-up, as compared with previous working, are quite as astonishing as the reported efficiency of the model which we examined.

REMEDY FOR THE BITE OF RABID ANIMALS. Mr. Youatt, a famous veterinary surgeon, who has been bitten several times by rabid animals, relates that crystals of nitrate of silver rubbed into the wound would positively prevent hydrophobia in the bitten. True or not it is easily tried, and is not dangerous.

NEW PATENTS AND INVENTIONS.

Under this heading we shall mention, from week to week, a selection of the most important, new and important inventions, also, the list of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

SADDLE.—Clara A. Bartlett, Oakland, Cal., claims an improvement in a side saddle which consists in having one of its horns or cranked thereon and attached thereto, so as to be operated substantially in the manner described and for the purpose specified. Patent issued during the week ending August 7th, 1866.

BODY CONFORMATORS.—S. O. Brigham, San Francisco, Cal., claims an apparatus or implement for the cutting and fitting of ladies' dresses and other garments, which when applied to the person will adjust itself thereto, and is provided with any suitable means for indicating the line or lines of the seams for the garment to be cut, substantially as described. Patent issued during the week ending August 7th, 1866.

WASHING MACHINE.—Amos Durant and Henry Gresson, Stockton, Cal., claim the application to the washing machine and combination of certain levers, working from different centers, and connected with a plunger and worked by a reciprocating motion, as set forth. Patent issued during week ending August 7th, 1866.

MODE OF TINTING PHOTOGRAPHS, ETC.—Chas. Elveena, San Francisco, Cal., claims a new mode of tinting surfaces for use in the arts, by the action of smoke or fumes, within a closed chamber. Patent issued during week ending August 7th, 1866.

SAFETY CAGE FOR MINES.—John Evans, Virginia City, Nevada, claims the employment of a lever and spring bar, in connection with a friction roller and guide pin, or their equivalents, arranged substantially as described and for the purposes set forth for the more safe and convenient management of safety cages in mines. Patent issued during week ending August 7th, 1866.

DRILLING MACHINE.—R. A. Thomas, Damascus, Cal., claims, 1st, The combination in a machine for drilling rock in drifts and tunnels; 2d, a stanchion post with a bar to support the feed screw and drill, and an adjustable box constructed and arranged substantially as described. 2d, he claims a square box fitted to the stocks of the drill and feed screw, substantially as described, so that they can be connected at pleasure. Patent issued during week ending August 7th, 1866.

BIDGE WATER GAUGE.—William P. Kirkland, San Francisco, Cal., claims, 1st, Aprons applied to a perforated star board sides of a box, substantially as and for the purposes set forth. 2d, A disk of glass or other suitable material, in combination with a float and index rod constructed and operated substantially as and for the purpose specified. Patent issued during week ending July 31st, 1866.

ATTACHING BURNERS TO LAMPS.—Warren P. Miller, San Francisco, Cal., claims the introduction of a grooved shank, with socket and springs or their equivalents, when made to operate substantially as set forth, and in the manner described. Patent issued during week ending July 31st, 1866.

QUARTZ CRUSHER.—Henry Pearce, San Francisco, Cal., claims the construction of a conically-shaped crushing mill, with an eccentric motion as described, for the purpose and in the manner set forth. Patent issued week ending July 31st, 1866.

ORE AND TIMBER CAR FOR MINES.—George Williams, Sterling Ferry, Colorado: 1 claim, 1st, The construction of the doors with a wider portion, b, to adapt them to be supported by the sides of the car, substantially as described. 2d, A car constructed with end doors adapted to be folded over the top for the purpose of converting it into a timber car. 3d, In combination with the above a trigger, C, provided with an inward projection adapted to be tripped by the post, D.

ELEVATOR.—George Williams, Sterling Ferry, Colorado: 1 claim, 1st, The elevating bucket, E, with the discharging lever, F, F, applied to the bottom of the bucket, substantially as described. 2d, And in combination with the above I claim the deflecting rollers, D, and curved guideways, K, K, arranged and operating substantially as described. 3d, The adjustable sections, J, employed to enable the bucket to be discharged at different heights, substantially as described. 4th, The binged chute, O, in combination with the levers, O2 and p, operating substantially in the manner and for the purpose described. 5th, The bucket, E, in combination with the hook, W, or its equivalent, the roller, U, substantially as described.

REDUCING OXYD OF LEAD.—Thomas Taylor, Washington, D. C.: I claim, 1st, The protoxyd of lead as a flux, in the reduction of lead dross, substantially for the purpose and in the manner herein set forth. 2d, The use of iron as a deoxydizer of the protoxyd of lead, substantially for the purpose and in the manner herein set forth.

Patents can be obtained for citizens on this Coast, through the Mining and Scientific Press Patent Agency, in one half the time it takes to operate through Eastern agents. From our familiarity with the subject of most California inventions, and the benefit arising from personal explanations, we are prepared to present claims with greater accuracy than could reasonably be expected of distant agents. DEWEY & CO., Patent Agents, 503 Clay street, San Francisco.

HENDY'S PATENT IMPROVED CONCENTRATOR.

We here give the first illustration of J. Hendy's latest pattern of improved concentrators. Its variation from his former plan consists in the manner in which the body of the concentrator is supported, doing away with the upper frame-work and discharging the apparatus for raising the distributor, as the hoisting of the same is rendered useless by the concentrator being self-discharging. The machine here represented is fastened to and supported by an upright standard underneath, which is held and worked in a deep step. The motion is imparted by either one or two connecting rods, adjusted to half-crank pins. The engraving itself well illustrates the new machine to the eyes of those familiar with the working of this class of gold and salphuretted savers, while those less acquainted with their operations are referred to the last page of to-day's issue for further description and illustration.

Mr. Hendy's new concentrator can be seen in working operation at the Union Foundry, in this

city. The inventor will continue to supply the former style of machines to those who may prefer them on account of their having been long and successfully used. Two of the old pattern were purchased during the past week for Arizona, by Messrs. Reed & Tyson.

THE ATLANTIC CABLE.—Before the great Atlantic cable had been in operation two weeks, and although it was found to work as well as the most sanguine of its originators had anticipated, it was, nevertheless, found to be totally inadequate to perform the work required of it. So great was the demand made upon the managers, that it would soon have been found necessary to greatly increase the already high rate of tariff fixed, in order to put a stop to the transmission of trivial messages of no business importance, but which must, nevertheless, take their turn to the exclusion of more important matters, had not the broken cable been fortunately picked up and secured, thus giving as two wires, one of which will be constantly occupied in transmitting messages to Europe, while the other will be exclusively devoted to return telegrams. The time is not far distant when another pair of wires will be found indispensable to transact the business which must continue to increase, as does all kinds of business, in proportion to the facilities for transacting the same.

FINE MARBLE WORK.—Our friends in the country, as well as those in the city, in want of good marble work, such as mantels, monuments, tombs, plambers' slabs, etc., will do well to call on Mr. John Daniel, 408 Pine street, where a large assortment of all the above kinds of marble manufacture are kept constantly on hand. Individuals calling upon him personally, or sending their orders from a distance, can always rely upon having them promptly and faithfully attended to. Mr. Daniel is an old advertiser in the columns of this paper, where his card may always be found.

Mr. A. T. Stewart has contracted for the window glass for his new house in New York at \$50,000.

A DRY DOCK FOR SAN FRANCISCO.—Work will be actively commenced on the proposed dry dock at Hunter's Point, on the first day of next month. The dock will be excavated out of solid rock, and will be 400 feet in length by 100 in breadth, and deep enough to dock a vessel drawing twenty-four feet of water. The cost of the work will be about \$400,000, and will be conducted under the direction of Col. A. W. Von Schmidt, the well known civil engineer of this city.

ENGRAVED TO ORDER.—Persons who desire to illustrate their individual establishments or business, should give us their orders for Engraving and Printing, and we will guarantee good work and reasonable prices. DEWEY & CO., Patent Agents, Publishers and Job Printers, 503 Clay at

STRANGERS visiting San Francisco can use the Burglar Proof Vault of the CALIFORNIA BUILDING, LOAN AND SAVINGS BANK, California street (one door from Sansome street), for the temporary deposit of Gold Dust, Coin, Bonds, etc., at a small monthly rent, according to the value of the property deposited, for which the Company will be accountable.

Brodie's Patented Improvements
FOR THE TREATMENT OF
Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER.
The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1.—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price..... \$600
No. 2.—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour..... 850
No. 3.—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Raywhite Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

BRODIE'S PATENT IMPROVED OREMAN ANALOGATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above Improved Barrel are hereby informed that on and after the 1st November, 1866, the royalty charged for using the same will be raised to the sum of \$100 per Barrel.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry-Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

12v13lf SAN FRANCISCO.

To Miners and Families Living in the Country.

DR. BOYNTON'S MEDICINE CHEST, is put up in San Francisco expressly for the use of families, and consists of a chest of moderate dimensions, neat in its appearance, containing those household articles, simple remedies, that families always feel like keeping on hand for immediate and common use, and a book of brief instructions, describing their use.

The object in preparing this Chest was not to make doctors, but for the simple purpose of nursing; hence, a majority of the remedies are such as are familiar to nearly all who are advanced in life, and the book is simply a representation of those plain truths relating to the department of the nurse already set forth in more extensive works. It was the object, not to say many things, but to say few things—to simplify and make plain for common use. And in selecting the contents of the Chest, the object was not to set forth something new and wonderful, but those of old and acknowledged worth.

In view of the above facts, physicians have everywhere encouraged the circulation of this chest in unmistakable terms. They recognize the fact that families do not, will not, need not call on them on the occasion of every slight derangement or infirmity. They do not and cannot deny the fact that such obligations of home care rest upon heads of families.

The book gives a description of nearly every medicine in the collection, their use, and their component parts, so that every person may know what he is receiving into his stomach or applying to his person. This openness and frankness is regarded by the best practitioners, and all considerate persons as justice, more than policy. The universal conviction of the more thoughtful is, that that which relates to our health and physical well-being in this life should, above all things, be known, and not kept in the darkness of secrecy.

In introducing this chest in the country, we always first submit it to the criticism of practicing physicians, and feeling the importance and seeing the necessity in this sparsely settled country of home-nursing, and seeing the adaptability of this chest, physicians in San Francisco, Sacramento, Stockton, Knight's Landing, Cheyenne, Marysville, Colusa, Oroville, Lodi, Folsom, and Auburn, have given it their hearty sanction. Seeing the necessity on this coast of people relying upon themselves in such matters, physicians in this State have remarked: "If I could choose but one for a family, I would every time choose the nurse instead of the physician." "If families would get a collection of simple remedies, with plain instructions for their use, they would do away with half the doctoring." "All families should possess themselves of a collection of common remedies, with plain instructions for their use." "I would like to see the chest in every family." "It is a convenience." "It is useful." "Much sickness and much expense might be saved by such home care."

We subjoin the following statistics from Sutter County, California:

"The undersigned have had Dr. Boynton's Medicine Chest in their families for the last few months, and willingly state that they regard it as a wise provision, strictly practical and highly useful." * * * *

Every person having the chest in the above named county has signed the above article. The publishing of the names being unnecessary, we withhold them and save space.

The undersigned have known Dr. Boynton's Medicine Chest for the last few months, and regard it as a wise provision, and highly useful in every family. The medicines being put up with instructions, its utility, convenience, and great economy are unquestionable.

Signed by Judge Hurlbut and 45 others.

Good Advice.—John H. Prentice, in his valedictory on retiring from the editorial chair, which he had filled for forty-two years, has the following:

"No man should be without a well conducted newspaper. He is far behind the spirit of the age unless he reads one, is not upon an equal footing with his fellow-man who enjoys such advantages, and is disregarding of his duty to his family, in not affording them an opportunity of acquiring a knowledge of what is passing in the world, as the cheapest possible teaching. Show me a family without a newspaper, and I venture to say that there will be manifest in that family a want of amity of manners, and indications of ignorance most strikingly in contrast with the neighbor who allows himself such a rational indulgence. Young men, especially, should read newspapers. If I were a boy, even of twelve years, I would read a newspaper weekly, though I had to work by torchlight to earn money enough to pay for it. The boy who reads will learn to think and analyze; and, if so, he will be almost sure to make a man of himself, hating vicious indulgence, which reading is calculated to heget a distaste for.

AN INTERESTING CASE to ship builders has just been decided by the Secretary of the Treasury. A vessel arrived at Galveston, Texas, having for her cargo the sections of two iron steamers, built in Glasgow, Scotland. The master of the vessel was fined \$1,000 for non-conformity with the registry law, and, refused admittance for the cargo of his vessel. The Secretary, however, directed that collector to admit the cargo as other merchandise, and also ordered marine papers to be granted the steamer, establishing the precedent of allowing vessels built in foreign Governments the benefit of our registry law.

The New Bedford (Mass.) *Standard* says the petroleum street lamps in that town explode occasionally, especially during the hottest evenings. The oil runs over from the wicks, takes fire outside of the lamps, heats them till the solder gives way, and the whole explodes.

Machinists and Foundries.

LEWIS COFFEY & RISDON,
Steam Boiler & Sheet Iron Works.

THE only exclusively Boiler Making establishment on the Pacific Coast owned and conducted by Practical Boiler Makers. All orders for New Work and the repairing of Old Work, executed in order, and warranted as to quality. Old Stand, corner of Bush and Market streets, opposite Oriental Hotel, San Francisco.

THE MINING PRESS comes loaded with a rich variety of mining intelligence, and all sorts of scientific interesting matter.—[Amador Ledger.]

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, Serew and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

ENGINES.—Marine Engines, Oscillating and Beam; Stern and Slide Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

BOILERS.—Locomotive, Flat, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Frater's concentrators, Wadley's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Eureka Iron Soregus, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

H. J. BOOTH & CO.

Vulcan Iron Works Company

[ESTABLISHED 1850.]

First, Natoma and Fremont Streets.

IRON FOUNDERS, Steam Engine and Locomotive BUILDERS,

Boiler Makers, and Workers in Sheet Iron, Brass and Copper.

These Works have lately been increased by the addition of new shops on Fremont Street, doubling the capacity of the original establishment. Their facilities for turning out machinery promptly and efficiently, are now unequalled in the State. Their Boiler Works have also been enlarged correspondingly.

The Company are prepared to execute orders for all classes of Machinery and Boiler Work, such as

Mining, Steamship, and Steamboat Machinery,

Railroad Machinery, Flouring Mills, Locomotives, Quartz Mills, Car Trucks, Sugar Mills, Car Wheels, Saw Mills, Housings and Irons; and

Manufacturing Machinery of Every Kind.

Sole Manufacturers of

HEPBURN & PETERSON'S REDUCING PAN AND AMALGAMATOR.

BEATH'S AMALGAMATOR.

HESE & MOORE'S IMPROVED HOWELL QUARTZ CRUSHER.

BAUX & GUILD'S AMALGAMATOR AND SEPARATOR.

FAUCHERY'S QUARTZ GRINDER AND WATER WHEEL.

JONVAL'S IMPROVED WATER WHEEL.

LEFFEL'S AMERICAN DOUBLE TURBINE WATER WHEEL.

STEVEN'S PISTON PACKING RINGS.

They have also a large assortment of Patterns for Pumping and Hoisting Machinery, Gearing, Pulleys, Water Mill Irons, Hydraulic and Screw Presses, Retorts, Furnaces, Grate Bars, House Fronts, Ornamental Fence Posts and Piling, Stove Ranges, etc., etc.

Quartz Stampers, Shoes and Dies, of the best Hard Iron. Quartz Screens of Russia Iron Punched to Order. 27

GEORGE T. PRACY, MACHINE WORKS,

Nos 109 and 111 Mission street, between Main and Spear, SAN FRANCISCO.

Pacific Forge Company.

FORGING AND IRON WORK.

THE PACIFIC FORGE COMPANY HAVE JUST RE-ERECTED, in this city, on Fourteenth street, near the machine shop of the San Jose Railroad, a large establishment for the purpose of forging and working in wrought iron. Our hammer is the largest upon this coast, and we are prepared to manufacture at short notice, all kinds of heavy forgings, car axles, shafts, steamboat cranks, piston-rods, wagon axles, and other similar work. This is the first general shop of the kind erected in this State, and we solicit the patronage of the public. All orders executed at reasonable rates, and with promptness and satisfaction. 19v12-3m

Our Patent Agency.

The PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS has been organized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

of Mr. LOCHHEAD, who has been in the business in San Francisco for the last fourteen years, and enjoys the reputation of having built ONE HUNDRED AND SEVENTEEN STEAM ENGINES.

Screw Propellers of all kinds, and Steam Boat Machinery generally, made to order, and warranted to give perfect satisfaction in every particular. 25v12-3m

Volta's Action.

Messrs. Editors: In an interesting article written for the San Francisco Mining and Scientific Press by Mr. Edward Pique, entitled "Source of the electric current in the Galvanic Battery," I observe reference is made to the following experiment described in Dr. Bird's Natural Philosophy, to prove that the different metals, by mere contact, produce electricity without any exciting fluid whatever:

"Two disks of different metals, when pressed together and suddenly separated, assume opposite electric states."

To demonstrate this, take a plate of copper and one of zinc, about four inches in diameter, each furnished with a glass handle fixed in its center; now connect a gold leaf electrometer with one plate, A, of the condenser, allowing the other plate, B, on the condenser to be connected with the earth. Press the copper and zinc plates together, holding them by their insulating handles; suddenly separate and apply one of them to the plate, A, of the condenser; again press them together, having previously touched them with the finger to restore their electric equilibrium, and re-apply the same plate to the same condenser. Repeat this about six times; then draw back the uninsulated plate, B, and the gold leaves of the electrometer will diverge with positive electricity if the zinc, and with the negative if the copper plate has been applied to the condenser."

It is generally understood that electricity may be excited, or called into activity by mechanical action, by chemical action, by heat, and by magnetic influence. Why the above enumerated means should develop electricity, or excite it from a latent or neutral condition is generally conceded to be an open question among philosophers. In the above experiment I think I observe another form of the well known instrument invented by Professor Volta, which he called the "Electrophorus"—signifying "producer of electricity." It consists of a simple disk of resin or other non-conducting material, and a metallic plate of less diameter supplied with a glass handle. Hold the metallic plate by the handle, and bring it in contact with the resin and touch the finger to the plate; then withdraw the finger, remove the plate by the brass handle, when it will be found electric; and by repeating the experiment rapidly a spark will be eventually obtained from the metallic plate, which may be employed to light gas, and for various interesting experiments. This may be aided by first exciting the resin by friction with dry cloth such as woolen, silk, etc. This is sometimes called inductive electricity. In the experiment of the simple contact of the metal and resin, it is possible that the friction of the air as it rushes between the plates when suddenly separated may produce electro dynamic action; and I opine that in Dr. Bird's experiment with two metallic plates the same cause may produce a similar effect. But aside from this—in connection with it, perhaps—I would like to inquire if the thin film of intervening air may not be the exciting fluid or medium which produces the electricity as exhibited by the electrometer, and especially as it is seldom free from humidity or moisture, which must assist the chemical action of oxidation which never can occur without development of electricity.

—[Am. Gas Light Journal.]

A NEW GUANO.—A discovery, which promises to be of the greatest advantage to agriculturists, has recently been made in Bolivia of a new guano, which, according to the testimony of the most eminent agricultural chemists in this country, equals in manurial effect the celebrated Peruvian guano. No accurate estimate of the extent of the beds has yet been attempted, but the supplies would, on a general view, appear to be very great—amplified sufficient to keep all farmers using what are called artificial manures in full supply for many years to come. Sufficient quantities have already arrived in New York, to allow of limited field experiments being conducted upon various crops the coming year.

GROWING POTATOES UNDER STRAW.—The editor of the Rural World says that on a recent trip to St. Clair county, Ill., he saw hundreds of acres of land covered with straw. The ground had been plowed, harrowed and marked off, and potatoes dropped, and then the whole surface covered about six inches deep with straw. The potatoes have no further attention till digging time, when two or three hundred bushels per acre are obtained. The straw keeps the weeds down, and the soil cool and moist. The straw is raked away in the fall, and there lie the potatoes white and clean. The editor also says that the "straw potatoes" bring the highest price in the market.

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

Rheumatism!!

ANOTHER WITNESS!

SALMON FALLS, June 17, 1865.

H. BOWMAN—DEAR SIR: HAVING HAD A FAIR test of the virtues of RICHARDS' REMEDY FOR RHEUMATISM, I take great pleasure in stating that its effects with me have been even better than its recommendations claim. In 1853 I first heard of the Medicine. I had then been for three years severely afflicted with Rheumatism, and having tried everything I could hear of, without any permanent benefit, I concluded to try this also. On taking the medicine, in three days I experienced great relief, and in one week was entirely free from pain, and had completely recovered the use of my limbs, which had become powerless, so much so that I could not dress myself without assistance. Since that time I have been free from Rheumatism. I have recommended RICHARDS' REMEDY to numerous friends, and in every case it has proved successful. I therefore take great pleasure in recommending it to all who are afflicted with Rheumatism, and especially to all mercurial chronic Rheumatism cases.

Yours respectfully,

ERASTUS PARSONS,

President of the Gen. Grant Mining Company.

RICHARDS' REMEDY is for sale by

SPIRITS OF TURPENTINE & ALCOHOL

NOTE.—We would specially call the attention of MILL owners and Engineers to our superior PARAFFINE OIL, which we manufacture from the California Petroleum. This Oil will not gum. Machinery thoroughly cleaned and lubricated with it will not gum, and after remaining at rest, can be started without cleaning off.

A sample can of our Paraffine Oil will be forwarded on application to us, as we desire a fair and impartial trial.

Lamps and Lamp Stock!

An elegant and complete assortment on hand.

4v13-3m19 414 Front street, San Francisco.

THE CALIFORNIA Aerated or Unfermented BREAD COMPANY.

Bakery on Folsom Street,

Between Tenth and Eleventh.....SAN FRANCISCO

Messrs. TAGGART, BULKLEY & DUFF, HAVING ASSOCIATED themselves in partnership, are happy in announcing to the public that they are now prepared, and would respectfully solicit, all orders for their truly wholesome and cleanly Bread. We have a sufficient number of delivery wagons at our bakery to guarantee to all who may favor us with their patronage a prompt delivery of fresh bread daily, Sundays excepted.

Through the kindness of the gentlemen of the following named firms we are privileged to keep an order box for the entry of all orders for the bakery so that they may reach our earliest attention:

Order box at C. J. Hawley & Co.'s Grocery, corner Second and Jessie Streets; Rowland & Walker, 647 Clay street; Plumb's Carpet Store, Montgomery street, opposite Lick House; G. W. Clark, Paper Hanging, corner Sansome and Clay streets. Orders handed to any of the route-men likewise. We expect soon to be prepared to supply Pastry, likewise the Boston Brown Bread, and Beans of the first quality. Due notice will be given.

The present Company is entirely independent of the former California Unfermented Bread Company, neither of them having been in any way connected with that company.

We would cordially invite the public to make a visit to our new bakery.

4v13-3m S. R. BULKLEY, Business Partner.

ASSAY AND BULLION BALANCES,

And from France and Germany, as well as the Eastern States, FURNACES, CRUCIBLES, MUFFLES, BLOW PIPE CASES, GOLD SCALES, CHEMICAL GLASSWARE, and every article required for ASSAY OFFICES, LABORATORIES, etc. We have given this branch of our business particular attention, to select such articles as are necessary in the development of the mineral wealth of this coast. A Full Assortment of DRUGGISTS' GLASSWARE and DRUGGISTS' SUPPLIES, ACIDS and CHEMICALS, constantly on hand. San Francisco March 6, 1865. 11v10-1f

By EXPRESS.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co.'s tariff) on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must themselves settle the same.

Judicious Resolutions.

Several of our most substantial and judiciously managed mining corporations have passed resolutions, since the approval of the new assessment law, requiring all notice of assessments and sales to be published in the Mining and Scientific Press, the only thorough (daily or weekly) mining journal on this coast. Our efforts to concentrate all mining advertisements in one paper, for the economical convenience of shareholders and assessment payers, are meeting with decided success. Those who believe in supporting the mining cause, should bear our paper in mind, and bring up this subject at the next trustee or shareholders' meeting.

San Francisco, April 7th, 1866.

City College Laboratories,

Southeast Cor. Stockton and Geary sts.

Practical and Analytical Chemistry and Metallurgy.

THOMAS PRICE,

Office, No. 719 Clay street, San Francisco. 8v22

Great Central Mining Company, Yuma County, Arizona Territory.

Notice is hereby given, that the regular Annual Meeting of the above Company, will be held on MONDAY, October 8th, 1866, at 4 o'clock P. M., at the office of said Company, No. 302 Montgomery street, for the purpose of electing a Board of Trustees to serve for the ensuing year; also, for transacting any and all other business that may properly come before said meeting.

O. D. SQUIRE, Secretary.

George Washington Gold and Silver Mining Company, Silver Mountain District, Alpine County, Cal.

Assessment No. 14.
Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventeenth day of September, 1866, an assessment of two and one-half dollars (\$2.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, only.

Any stock upon which said assessment shall remain unpaid on the eighth day of October, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fifth day of November, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. G. WOOD, Secretary.

Office, 333 Montgomery street, San Francisco.

Notice.—At the above meeting of said George Washington Company, assessment No. 13, levied August 14, 1866, for one dollar per share was rescinded, and all stockholders having paid the same will be credited with the several amounts so paid by them respectively on assessment No. 14 of \$2.50 per share, levied as above. By order of the Board of Trustees.

A. G. WOOD, Secretary.

Hansom Copper Mining Company.—Location: Low Divide District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighteenth day of September, 1866, an assessment of fifteen (15) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, S. S. SWEET, No. 609 Market street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the eighth day of October, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fifth day of November, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

S. S. SWEET, Secretary.

Office, No. 609 Market street, San Francisco. 8v22

Humboldt Gold and Silver Mining Company, Sierra District, Humboldt county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twentieth day of September, 1866, an assessment of two dollars (\$2) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, O. HARRA TAAFFE, No. 430 California street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the first day of November, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twenty-seventh day of November, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

G. O'HARRA TAAFFE, Secretary.

Office, No. 430 California street, San Francisco. 8v22

Keystone Mining Company, Copper Canon District, Copperopolis, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighth day of September, 1866, an assessment of five (\$5) dollars per share was levied upon the capital stock of said Company, payable immediately, in gold coin of the United States, to the Secretary, at his office, No. 440 California streets, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-second day of October, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the tenth day of November, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. P. SUTTON, Secretary.

Office, 440 California street, San Francisco. 8v22

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. Those discrepancies, although arising from the inexperience of agents, are none the less dangerous to applicants for patents. Whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press Patent Agency has strictly complied with the regulations of the Department, and properly filed all necessary papers as Claim Agents.

Illegal Supplemental Advertising.—It would be well for Mining Companies, whose advertisements are repeatedly appearing in the Supplements of daily papers, to inquire into the legality of that class of advertising.

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; a, Dies; c, Shoes, and o, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan when properly constructed, are respectively 177, 118 and 132.

That is, the respective millers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes direct from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been furnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,
WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the
PACIFIC FOUNDRY,
171 San Francisco.

LEFFEL'S American Double Turbine

THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given universal satisfaction whenever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These Wheels are adapted to use from 10 to 500 inches of water, and from 4 feet to 50 feet fall. Let us know how much water you have either in miner's inches or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to
KNAPP & GRANT,
San Francisco.

Also—
Leffel's Lever Jacks,

For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks, for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind. For sale by
KNAPP & GRANT,
San Francisco.

PAGE'S PATENT FOR RAISING SUNKEN VESSELS!

SHIPPING AND INSURANCE COMPANIES, AND other parties upon this coast or in the Atlantic States, having occasion to avail themselves of this invention, which has been tried and proved a success, will please address, for the present, JOSEPH DEVINNEY, San Francisco or at the office of the Mining and Scientific Press, 8713

AUSTIN Z. PAGE, Patentee.

Book Printing should be considered and treated as one of the higher branches of the "Art of Arts," and its execution entrusted only to experienced and intelligent workmen. Strict attention will be given to all orders for BOOK AND PAMPHLET PRINTING entrusted to the Mining and Scientific Press Job Office.

BAUX & GUIDO'S Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine Scientific Knowledge with Practical Experience, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgamators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIDO'S Pan, are the following: The trilling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Grady's Gravel Cement Works, Nevada county; Wainman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Hugh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address
J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 493-6dF

It tells us truly the Minute, Hour, Day of the Week and Day of the Month.

HORTON'S PATENT CALENDAR CLOCK!

MANUFACTURED BY THE

ITHACA CALENDAR CLOCK COMPANY,

Ithaca, N. Y., and for sale by

W. J. EGBERT, Agent,

At JOH. M. SEAMAN & CO'S, 631 WASHINGTON STREET, San Francisco.

THIS TIME PIECE costs but a trifle more than any other good clock, and is just the article for every well-regulated business house, office, saloon, or, in fact, any place where a handsome, perfect time-keeper is duly appreciated. The Clock has two dials, the first being the same as an ordinary clock; the second has but one pointer, and shows the day of the week, the month and day of the month. It is arranged to mark the days in leap years with equal regularity. It is an eight-day piece, and runs from year to year without change. It can be examined at the Office of the Mining and Scientific Press. 2v13p16-1f

To Ditchmen, Millmen and Others Requiring IRON PIPE.

M. R. ROSE, CORNER OF 9TH AND K STREETS, Sacramento City, has facilities unsurpassed on this coast for the manufacture of IRON PIPE of every description. He also has on hand a deep well FORCE PUMP, of his own invention and manufacture, well adapted for oil wells. His tools being portable, pipe can be manufactured on the ground. 19v12

EXCELSIOR PUMP!

HOOKE'S PATENT!

CHALLENGES COMPETITION!

THIS DOUBLE-ACTING SUCTION AND FORCE PUMP CHALLENGES COMPETITION for simplicity, durability and power, and will work at any depth. The pistons for Mining Pumps are packed with hemp. The valves are reached by simply removing the "bonnets," thereby avoiding the trouble of raising a long column of pipe. They will raise as much water as TWICE their size of single-acting Mining Pumps, and are sold at half the price. We have never heard of the valves in this Pump being out of order. For their many superior points they are fast replacing all other Force Pumps. Reference can be given where this Pump is working with eighteen others of different patterns, and is pronounced THE BEST; also, from some of the best miners in the State who have them in use. For manufactories, farms or domestic use, we warrant them the best and cheapest. All sizes adapted to any tower or any purpose. For sale by agents throughout the State.

S. B. STODDARD,
Corner of Battery and Pacific streets. 25v12-3m

June 23, 1866.

Union Amalgamator.

This Valuable Invention

IS FAST FINDING ITS WAY INTO GENERAL USE, NOT by means of combination of capital and influence, but on the strength of its own merits, and upon the principle that what is known to be good will be appreciated. Fractious men acknowledge the UNION PAN to be scientific, the best, the cheapest, and most profitable. It now stands first on the list of all pans in use for the purpose of

Working Gold and Silver Ores.

It has been found that a low class of ores, also tailings from Mills, Sulphurets, etc., that will not pay to work with the common pans, may be worked with this and obtain large profits. The UNION PAN is manufactured in two sizes, and capable of operating upon large quantities of ore in the most efficient manner.

Parties interested in Quartz Mining, Mills, etc., will find it to their advantage to call and examine for themselves, and see its operation.

Gold and silver ores tested by regular mill process, at moderate cost, by

STRONG & CO.,

San Francisco Foundry, corner Mission and Fremont streets, where orders will receive prompt attention. 15v12-3m

Economy in Advertising.—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than any other rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

(Written for the Mining and Scientific Press.)

Humboldt County Oil Prospecting.

EDITORS PRESS:—Since my last, the Erwin Davis and Jeffrey companies have suspended operations—the former at a depth of 1,166 feet, the latter at 830 feet. The Davis company will resume work as soon as necessary repairs are made. No company is now working in this valley.

Parties interested in the development of the oil interests in this vicinity, are now about to inaugurate a plan by which the question as to the existence of petroleum in paying quantities in this county will be settled.

They purpose raising, by subscription, a sum sufficient to thoroughly prospect a certain locality, employing intelligent, practical men, and the services of a steam-engine, in lieu of the spring pole.

Your correspondent is of the opinion that they will select the North Fork of the Mattole as the most promising location. Joell's Flat is also mentioned in this connection.

In all probability the engine on the Jeffrey company's works will be employed by them, as negotiations are now pending with this in view. Mr. Wentworth, of the Jeffrey company, is now in your city on business connected with the enterprise.

The Yosemite company, in the upper valley, are about to resume operations, Dr. Pugh having been relieved by Dr. Bell as superintendent.

The Fanner Farm Well company, in the upper valley, have resumed work, but with what result we are not advised. More anon, Petrolia, Cal., Sept. 2d, 1866. DEX.

ADDITIONAL.—Under date of Sept. 10th, our correspondent states that the Davis Well has been put in excellent repair, and will go down to the depth of 2,000 feet, if possible, if a vein is not struck before. The North Fork company's works were to be sold on the 10th, on a judgment for \$260. The employees, including "Dex," are out and injured in the sum of \$800, due for wages. Our correspondent speaks of rumors about the Jeffreys company, which we do not deem it best to publish until they are confirmed.

The British ironmasters have discovered the value of anthracite coal. They had not hitherto been able to use it. But now Mr. L. H. Blackwell, of South Wales, reports that they had even surpassed our countrymen, being able to make a ton of Nos. 2 and 3 pigs with something less than a ton of anthracite—the previous method requiring three tons of coal—while we have been in the habit of using two tons of anthracite. This is the latest and most signal refutation of the British ex-Chancellor's recent statement before Parliament, that the coal of the United States possesses so much anthracite that it is not fit for smelting purposes.

Auction House.—Messrs. Olney & Co. have opened a General Auction and Commission House, No. 413 Montgomery street—a very central and convenient location. Mining and other Corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Besides every kind of auction business, this firm will pay special attention to the purchase and sale of real estate in Oakland. ctf

STOCK CERTIFICATES, STOCK TRANSFER JOURNALS, STOCK LEDGERS, ASSESSMENT RECEIPTS,

Knox's Improved Patent Amalgamator and Separator,

With Palmer's Patent Steam Chamber or Die.

For further particulars, inquire of

16v13-12q

At the Golden State Iron Works, No. 19 First street, San Francisco.

THIS CUT REPRESENTS AN AMALGAMATOR AND SEPARATOR THAT HAS STOOD THE TEST OF SEVERAL YEARS' PRACTICAL WORKING IN THE GOLD MINES OF CALIFORNIA, AND FOR NEARLY THE SAME TIME IN THE SILVER MINES OF NEVADA, HAVING BEEN INTRODUCED INTO THE FIRST STEAM MILLS BUILT IN THE THEN TERRITORY, SINCE WHICH TIME THEY HAVE BEEN SUCCESSFULLY WORKING AGAINST ALL COMPETITION.

The great advantages these Amalgamators have over any others, are—

1st. Much Less Cost.

2d. They do not "flour" the mercury, and collect more than may have been "sickened" in the battery or grinders.

3d. The "sloshing" motion given to the pulp (by the revolution of the miller under the stationary frame) against the amalgamated copper plates that are fastened to the frame, and by this means catching the fine gold and mercury that will not settle.

4th. The gate in the cone, through which the pulp is discharged, from the top, and where there is the least motion, thus precluding the possibility of any granulated mercury or fine gold escaping.

There are over 500 of them in use in California and Nevada, where those interested can see their practical workings.

ISRAEL W. KNOX, or

W. A. PALMER, Inventors,

At the Golden State Iron Works, No. 19 First street, San Francisco.

CAUTION!

NOTICE.—TO WHOM IT MAY CONCERN.—THE PUBLIC are hereby notified that a patent was allowed Dec. 27th, 1864, and issued June 27th, 1865, to Professor Henry Wurtz, for the use of Sodium and Amalgams thereof with quicksilver, in the extraction of precious metals from their ores. All persons using said Amalgams, or purchasing or selling Sodium or said Amalgams, for use in the treatment of gold or silver ores, are hereby cautioned that they will be prosecuted to the full extent of the law.

ANNUAL REPORT

—OF THE—

Pacific Insurance Company.

IN COMPLIANCE WITH THE ACT OF THE LEGISLATURE OF THE STATE OF CALIFORNIA, entitled "An Act concerning Corporations," passed April 22, 1860, the Pacific Insurance Company of San Francisco makes the following Annual Report:

I.—The amount of the Capital Stock of this Company is SEVEN HUNDRED AND FIFTY THOUSAND DOLLARS, and paid in GOLD. \$12,973,949

II.—The amount of the Assets is ONE MILLION AND FIFTY-ONE THOUSAND, FOUR HUNDRED AND TWENTY DOLLARS AND THIRTY-SEVEN CENTS. \$1,051,420.37

III.—The Company has NO DEBTS.

IV.—The amount of insurance effected during the year, and which remained in force December 31, 1865:

Fire. \$12,973,949

Marine. 454,403

This Company commenced underwriting Marine Risks, August 1, 1865.

V.—This Company insures against the following risks, viz: BUILDINGS, HOUSEHOLD FURNITURE, MERCHANDISE, RENTS, LEASEHOLDS, VESSELS IN PORT AND THEIR CARGOES, and other PERSONAL PROPERTY, AGAINST LOSS OR DAMAGE BY FIRE.

Also, on CARGOES, TREASURES, COMMISSIONS, PROFITS, and WAR RISKS, and ON ALL MARINE AND INLAND NAVIGATION RISKS, TO AND FROM ALL PORTS IN THE WORLD.

VI.—This Company will take on any FIRST-CLASS RISK not to exceed \$75,000 (the limit fixed by law), and on all large risks will reinsure to an extent consistent with PRUDENCE in other RESPONSIBLE COMPANIES.

TUNNELING.—There seems to be a great rage just at this time for tunneling rivers and other water channels. Chicago is advertising for a tunnel with three separate roadways under the Chicago river. A tunnel is also talked of under the Mississippi at St. Louis. The East River, between New York and Brooklyn, and the Straits of Dover, between England and France, have long been a standing problem for engineering skill in this direction, and it is predicted that but a few years will elapse before the locomotive will be thundering its way under the Hudson River to New Jersey. A large amount of scientific labor is now being earnestly brought to bear upon schemes, the conception of which, a few years ago, would have been thought the height of folly.

THE WALTZING OR PLANETARY PAN.—We are pleased to learn that the question of infringement growing out of the similarity of the two pans recently invented and patented by Thomas Hanshrow and J. S. Crall, has been amicably settled by the parties interested, and that these pans will soon be introduced into general use. The parties most immediately concerned have acted wisely in coming to an amicable understanding as they have, and no doubt each will be more benefited than though they had adopted the usual course of submitting their differences to the settlement of the courts, and expended their profits in feeing lawyers.

THE OAKLAND COTTON MILL, working thirty-two looms, with other machinery in proportion, is run by a 40-horse steam engine, employs twenty-five hands, mostly women of experience from the country, and is turning out some 1,500 yards per day. Although the mill has been in operation but a short time, and running at its full capacity, a ready sale is found for all the goods as fast as they can be manufactured.

We take pleasure in calling attention to the advertisement of Dr. Boynton's Medicine Chest, to be found in another column. It is a chest peculiarly fitted for use in the family and the camp, and bears the sanction of physicians in various parts, some of whom we know to be among the best in the country. As it is designed for the use of the family, nothing can be more honorable than subjecting it to the criticism of such physicians. We have secured one for our private use.

These chests can be obtained at the lowest rates by addressing this office.

OUR CABINET.—We shall notice next week a fine lot of specimens from Mr. A. H. Howk, of Weston, Nye county, Nevada; also, a petrification, from Mr. Geo. W. Bunnell.

Hendy's Improved Patent Self-Discharging Sulphurets

PRATER CONCENTRATOR

Is Receiving Universal Favor.

Reference is made to the following Mills which have them now in use:

BENTON MILL, Bear Valley, Mariposa County.
LOUISIANA MILL, near Coulterville, Mariposa County.
OPHIR MILL, near Newcastle, Placer County.
C. H. SCHENBLE'S MILL, Doty Flat, Placer County.
JERSEY BLUE, near Folsom, Cal.

SPRING HILL MILL, Amador, Amador County.
GOLDEN GATE MILL, Volcano, Amador County.
RAWHIDE MILL, Jamestown, Tuolumne County.
TRIUNFO G. & S. M. CO., Lower California, Mexico.

And in use in many other parts of this State; also in Idaho, Arizona, Colorado and Mexico.

They may be seen in operation at the GOLDEN STATE FOUNDRY, No. 19 First Street, San Francisco.

DESCRIPTION:

FIGURE 2 is a sectional view. C, is the Hopper in which the tailings are thrown. The tailings then distribute to the Distributor, B. The tailings enter the pan, A, at its periphery, and the debris discharges near its center, and passes off in the spout, F. The sulphurets discharge at gate, E, amalgam and quicksilver at plug, I, J, is a horn-shaped cavity for collecting quicksilver and amalgam. S, is the sulphurets. M, M, the agitating bars, with copper plate, coated with mercury.

The agitating bars operate on top of the pulp. They are acknowledged to be, by those using them, a valuable improvement. [An extra charge of \$15 is made when these bars are furnished.] The pan, A, shows a curve-linear bottom, which gives a more precipitous descent near its center, for the purpose of forcing the sulphurets towards the periphery. It will be noticed that the centrifugal force diminishes towards the center of the pan, for which reason the inclination is increased for the purpose above mentioned.

The pan, A, has an inclination at its periphery, towards the gate, E, for the purpose of forcing the sulphurets to the discharge gate. At the same time the center rim is level; the sulphurets, S, being forced by the oscillating motion of the machine, and are discharged through a small opening in the pan at gate, E.

JOSHUA HENDY, Esq.,—Dear Sir: I have been using three of your Improved Concentrators for the past four months, at the Spring Hill Mill, and they give perfect satisfaction.

Yours truly,

AMADOR, July 20th, 1866.

WM. H. HOOPER.

JOSHUA HENDY, Esq., San Francisco:—My Dear Sir: It gives me pleasure to inform you that the four "Improved Self-Discharging Prater Concentrators," which I purchased from you, have now been in operation in the Rawhide Mining Company's Mill for more than two months, and have more than realized my expectations.

I am free to say it is the best Machine for saving Quicksilver, Amalgam, and Sulphurets that I have ever used or seen used for that purpose. I shall take pleasure in showing any one interested the Machine in operation, who will call at the mill. I shall need four more as soon as the balance of our mill is completed.

R. P. JOHNSON, Superintendent Rawhide Mill Company.

A Circular giving further particulars will be mailed to any part of the United States free of expense. Address,

JOSHUA HENDY,

402 Montgomery street, San Francisco, Room 3, Fourth Floor.

Pacific Mail Steamship Co's

THROUGH LINE TO NEW YORK,

Carrying the United States Mail.

LEAVE FOLSOM STREET WHARF, AT 11

o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the company's splendid steamers from ASINWALL for NEW YORK.

On the 10th, 18th and 30th of each month that has 30 days.

On the 10th, 19th and 30th of each month that has 31 days.

When the 10th, 19th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following.

Steamer leaving San Francisco on the 19th touches at Manzanillo. All sail at Acapulco.

Departures of 18th or 19th connect with French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America.

Departure of 10th connects with English steamer for Southampton, and P. R. R. Co.'s steamer for Central America.

Departure of the 30th connects with English steamer for, and the port of the new mines.

The following Steamships will be dispatched on dates as given below:

September 18th—COLORADO.....Capt. J. T. Watkins.

Connecting with HENRY CHAUNCEY, Capt. Gray.

September 29th—SACRAMENTO.....Capt. J. M. Cavaril

Connecting with OCEAN QUEEN, Capt. Weir.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Inman Line, can be obtained at office P. M. S. & Co., San Francisco.

For Merchandise and Freight apply to Messrs. WELLS, FARGO & CO.

The splendid steamship COLORADO will be dispatched for CHINA on TUESDAY, January 1, 1867.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorf streets.

Our Patent Agency.

THE PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS, has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of Letters Patent from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

SILVER PEAK AND RED MOUNTAIN MINES, NEVADA.

From a reliable source we have intelligence from the Silver Peak and Red Mountain mining districts, situated in Nye county, State of Nevada. The first named are a cluster of silver ledges, of great richness, that have been successfully worked during the past year, which has demonstrated to the satisfaction of the owners their intrinsic value.

The machinery heretofore erected at the Silver Peak mines, is a 10-stamp mill with which the company crushed their silver ores. This mill will in future be used for crushing gold ores from the Red Mountain mines exclusively, and new works of magnitude will be erected to work the ore from the silver ledges. The additional machinery now being sent forward to Silver Peak, consisting of two 100-horse power engines, and two large double flue boilers, weighing 10,000 pounds each, to each engine, will be more in conformity with the energy displayed in this discovery and necessary development of these extensive mines, and the intention of the owners to immediately erect competent reduction works, regardless of cost. It also indicates that we may reasonably anticipate a good report from what have been deemed among the best mines on the Pacific Coast.

The Red Mountain mines are in the same vicinity and adjacent to the Silver Peak, and are large, well-defined gold mines, which have been very profitably worked by the Red Mountain Company, with but indifferent machinery, the average net proceeds having exceeded forty dollars to the ton. These are the mines recently purchased by Samuel B. Martin, from Carpenter, Cammack & Co., for \$78,000. It is the intention of the present company to connect these two districts by railway, so that the gold ores of the Red Mountain can be transported with facility and cheapness to the Silver Peak mills, where every convenience exists for their reduction, and to which all interests in these districts are tributary. The mines have been, and will continue, under the supervision of S. B. Martin, one of the owners, who is now in New York. We are assured that from his energy and ability as a miner, and his reputed wealth, he will doubtless prove these mines equal to their reputation.

BRODIE'S IMPROVED GERMAN BARREL.

We give annexed an illustration of Brodie's improved German barrel for amalgamating gold and silver ores. The improvement consists in lining the barrel with blocks of wood, placed so as to present the end of the fiber to the action of the ore, thereby rendering the durability of the machine much greater than the former mode of constructing it in such a way as to allow the wear of the ore, in the process of working, to come directly across the fiber of the wood. It is claimed that a barrel, when constructed after this manner, will last four or five times as long as when made in the ordinary way. The expense of making the lining, in

OIL FROM SHALES AND SAND.

There appears to be a marked superiority in the character of the oil derived from shales over that obtained from sand, and, as a general thing, an increase also in the yield. The theory is that the shale is the original matrix of the oil; while that found in sand and the sandstones have been derived from the shale by a process of natural distillation, during which it has lost a portion of its most valuable properties. Hitherto but little attention has been paid to the oil-bearing shales of this State, from the fact that the oil, being contained in the shale in chemical combination, is consequently, not so apparent either to the eye

able fissures occur. California need be under no apprehensions of a lack of oil, because it is not found naturally. She possesses an abundance of the oil-bearing shales, which will yet open up a large field of industrial enterprise, and be found a source of much profit to our people. The best coal from which distillations of oil are made in Great Britain, and from which immense fortunes have been made, yields, on an average, about sixty gallons of oil to the ton. Any amount of shale may be found in this State, which will yield from thirty to thirty-five gallons, which can be worked to a handsome profit, when treated after the improved methods recently introduced into England, and which will soon be introduced into this State. The shales of Fifeshire, Scotland, yield about thirty gallons of crude oil, and twelve of ammoniacal liquor per ton of shales. This latter is an important item in England, but we are not aware that it has ever been utilized to any extent in this country. It does not come from the coal or oil proper, but is obtained from the hygroscopic water which accompanies the coal, and is formed by a union of the nitrogen of the organic substances from which the oil or coal is derived, with that portion of the hydrogen which does not enter into combination with the carbon.

BRODIE'S IMPROVED GERMAN BARREL.

this improvement, is less, by seventy-five per cent., than the price of making the ordinary barrel. The blocks of which the lining is made are very rapidly cut to fit, by a circular saw. The German barrel is generally considered, by miners and millmen, as one of the best amalgamators ever devised for saving silver, and it is also considered, by many, as equally effective in amalgamating gold.

The accompanying engraving exhibits a perspective view of the barrel, with Brodie's improvement attached. Letter B, shows the interior of the barrel with lining joints broken. Letters BB, show the blocks or lining for barrel. Letters CC, show the interior and exterior ends of the barrel. Letter D, shows the spider (with center) which, when adjusted and secured by the bolts, FF, makes the barrel complete and fit for use. Letter E, shows the aperture or plug, where the amalgam and mercury are drawn off. Letter A, shows the exterior of the barrel, which is made of boiler iron.

At the Exhibition of the Mechanics' Institute, in 1864, a premium was awarded to Mr. Brodie for this valuable improvement, for which he also obtained letters patent of the United States. As stated last week, the proprietors advertise in this paper their determination to raise the royalty on the manufacture of these improved barrels 100 per cent. after the first of November next.

or smell as that mechanically mixed with the sandstone. We have recently seen several specimens of oil-bearing shale taken from the immediate neighborhood of oleaginous sandstones, which, because they present very little indications of oil to the senses, have been passed over as worthless, while the sand near by has been highly prized, simply because it shows oil abundantly. A more close examination, aided by a small retort, will show the observer that in the case of the sand the oil is found merely as a coating upon the surface of the particles of sand, giving them an oily appearance; while in the shale the reason of no oil being visible is due to the fact of a semi-chemical or dormant admixture with its earthy matrix.

The working of shales for their oil is now being quite generally introduced throughout the Atlantic States, and present indications lead to the almost inevitable conclusion that it is to this source, instead of to wells, that the world is to look for its permanent supply of petroleum. Excavations in the oil regions are everywhere developing immense masses of oil-bearing shale, far surpassing in extent the coal deposits. The natural oil is now considered but an accidental occurrence, probably resulting from gases under great pressure, and will be found only in those localities where favor-

STILL ANOTHER SUBSTITUTE FOR EMERY.

We have already spoken of the recent introduction of furnace slag for emery. We have since learned of still another substitute, which requires but little or no waste in the process of preparation—pulverized glass. A party in New York has recently commenced the preparation of this new material on a large scale. They buy up old glass—such as broken bottles, window glass, etc. The great trouble heretofore has been to reduce the material to the required degree of fineness. Stamping and bolting after the manner of bolting flour has to be resorted to, to reach the required degree of fineness. We are told that some of the machinists in New York, who have given this new preparation a thorough trial, prefer it to the best prepared emery.

THE GLOBE FOUNDRY AT STOCKTON.—This foundry and machine shop, which has already become quite an extensive establishment, is still further enlarging its capacity. We learn from a private letter, that the proprietors are now putting up a fine brick workshop in addition to their previous shop-room. This establishment turns out good work. The engines for the steamer Corn were built there. The advertisement of Messrs. Keep, Blake & Co., proprietors, will be found in our paper.

THE DOCTORATE OF LITERATURE is the name of a new academical degree created by the University of London, as more appropriate, when conferred upon a man of letters, than that of Doctor of Laws.

TO CORRESPONDENTS.—We acknowledge the reception of the following interesting communications: "J. A. M." concerning fragments of meteoric iron and other specimens; from "W. T. Rickard," of Virginia City; "J. S. L." of Meadow Lake, and "G. J." of Auburn.

[Written for the Mining and Scientific Press.]

SEVENTH ANNUAL FAIR OF THE SAN JOAQUIN AGRICULTURAL SOCIETY.

[Held in the City of Stockton during the week ending September 22d, 1866.]

The Fair opened on Tuesday morning. The Pavilion was handsomely decorated, and presented a very fine and lively aspect, although but partially filled, and it was not until the close of the second day that the tables presented a full appearance. Upon the right, in entering the Pavilion, are the vegetable stands, well filled with fine looking articles, not many of monstrous size, but all just about the thing for the table. Samples of wine were displayed on the south side, agricultural implements, housekeeping articles, and hardware on the eastern extremity, while the north side was almost entirely devoted to sewing machines. The tables in the center were laden with rich burdens of fruit, and those between the fruit and the sides of the hall were claimed by the ladies for the exhibition of their handiwork. Having thus given you a bird's-eye view of the entire hall, I will now make note of the various departments.

The first prominent object on entering is a grocery wagon, manufactured for R. B. Parker & Co., by Matteson, Williamson & Stowell, as fine a piece of work as can be produced in the State, and one which speaks well for the mechanics of Stockton. Near this is a table of preserved fruits, jellies, pickles and wines; as the vessels were all sealed there was no opportunity of testing them, but they looked the embodiment of luxurious living.

The fruits were superb; but, like the wines and jellies, "hands off." The favorites seemed to be a plate of peaches and one of nectarines, which were by far the handsomest fruit I have ever seen. They were raised at Mountain Pass, Tuolumne county. Besides these there were others of no mean merit, and fruit-growers in other parts of the State will have look to it or they will be behind in the race. The apples were in great variety, with a list of names too long to be embodied in this report. Quinces large and aromatic, and pears of a size and quality to suit the most fastidious, were also exhibited.

What wonder is it that men love wine, when the fruit from whence it is produced presents such an inviting appearance? Such large bunches of grapes, with a promise of fine flavor, almost tempted one to wish he were a boy, with a low fence around the vineyard, no dogs about, and a propitious night. L. F. Jarvis, of Tuolumne county, exhibited sixty varieties, and Mr. Despois, of Stockton, as many more, besides a great number of smaller lots.

In dried fruits Mrs. Bateman seemed to take the lead. Her pears, apples and peaches were more like wax-work than dried fruit, so clear and beautifully cured; but, alas! here, too, it was "hands off." The exhibit of this branch of industry was not so large as it should have been, as there is no greater source of luxury during the winter months.

The exhibit of cereals was meager, indeed; but few samples, and those mostly if not all by grain buyers. They were fine productions, but why did not the farmer who raised them make the entry and compete for the premium, and tell when he sowed, and how much seed he spread to the acre, how much the land produced to the acre, and give such other information as would be of value to his neighbors, rather than have the broker choose the best from hundreds of farms, and stick up a few little sacks, and leave those who desired information to go and buy it by hard experience. This being now the staple product of this district, large premiums should be offered, and each exhibitor should be compelled to give an accurate statement of the manner of raising his grain. By making the premium large, farmers, in hope of receiving it, would take the trouble to be on hand, and would gain information which would add materially to the wealth of the country. Give smaller premiums to horse races, and add to the premiums for staple products.

The agricultural implements at the Pavilion are nearly all of Eastern manufacture, and have been so often described that it would be tiresome here. There is one innovation this year, however, which is worthy of notice, and that is the Horse Fork, a trial of which took place on Friday. There are two, both made in Stockton, which are competing for the supremacy; they are improvements on Eastern manufacture. I refer to Overhiser's Grain Elevator and Matteson's Horse Fork. These forks do the work of a large number of men in passing the grain from the stack to the threshing machine.

Hutchinson's Wine and Cider Mill, for extracting the juice of the grape without cracking the seeds, is of great advantage to wine makers, as it enables them to produce wine without the acrid taste which the broken seeds always impart to it.

The Milking Machine, illustrated in the Press a short time since, is the source of much merriment and no little wonder.

Of wool there is not a single sample from the district. Mr. McConnell, of Sacramento, has a very fine lot of fleeces of Merino wool, of his own growing, besides a large number of samples from abroad.

Perhaps the most attractive part of the Pavilion was the stand occupied by Mr. Prevost's silk worms, and their productions, and I believe he has been eminently successful this season in keeping his tender pets alive while traveling. He exhibits the eggs, the young worm just hatched, the worms feeding, and the moth. Some of the eggs were hatched in the hall, thus giving the curious a fine opportunity of gaining information. The samples of cocoons are in great variety, and the ladies appear to take great interest in this branch of culture; the majority of the samples being entered by ladies.

Minerals do not bear much fruit in this part of the world, the only collection being the property of Rev. A. S. Nicholson. Quite a large cabinet, although collected during the last year and a half, some of the specimens being very rare.

On Thursday evening the Hon. F. M. Pixley delivered the address. He spoke over an hour, and was listened to with great attention, and his remarks were well received and heartily cheered at times; but what connection they had with agriculture would have been hard to decide, but for the place. With his usual tact, he said some things to please all and offend none.

At the Fair Grounds, or rather the Society's Race Track, the attractions were not so numerous. The stock, what there was of it, was good; but here again can be seen the lack of interest on the part of the farmers.

The colts shown are some of them very fine, and evince much care on the part of their breeders, and give promise that at no very distant day fine stock will not be scarce in this section.

The number of thorough-bred cattle was very limited, but good, and the sheep and swine would do credit to any exhibition. A lot of Cashmere goats attracted much attention, and were really a pleasing and beautiful sight.

The races, although attracting great crowds, were but small affairs.

The Fair is said to be a success, as compared with former ones. It may have been a success financially, but how far it succeeded in the object for which it is ostensibly held, may be a matter of speculation. Until the farmers will take more interest in the products of the farm than in a scrub-race for a small purse, they cannot expect to be much benefited by fairs.

ORRIN.

COARSE AND FINE GOLD.—It is said to be a singular fact, often remarked by buyers of gold dust in this State, that the large lumps of gold are almost always poorer in quality, than the smaller or ordinary grains obtained from the same locality. The above fact was communicated to the California Academy of Natural Science, and published in the proceedings of September 5th, 1864.

SODIUM AMALGAM.

THE AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, AT BUFFALO.

At a late meeting of the American Association for the advancement of science at Buffalo, Professor Henry Wurtz, the American discoverer of the application of sodium to gold and silver amalgamation, read a paper entitled, "On the Utilization of Sodium in Gold and Silver Amalgamation," the substance of which is reported as follows, by a correspondent of the New York Tribune:

Prof. Wurtz stated that very much discussion has been roused during the past year, arising out of his recently announced discovery of the extraordinary effects of the alkali metals in amalgamation; and much further progress having been made, he thought the Association would be interested by a subject now regarded as of so great public importance. The investigations made last year by Prof. B. Silliman, on California ores, many of which were communicated to the National Academy of Sciences last winter, and widely copied in the newspapers, were continued with confirmatory results.

SOME OBJECTIONS CONSIDERED.

Some objections to the use of sodium for silver ores, on the part of a California metallurgist named Kustel, were then briefly discussed. Kustel has erred mainly in supposing that the purpose of the sodium amalgam was to decompose silver ores by extracting their sulphur by sheer force of chemical affinity. The rapid and perfect collection and separation from a slime or pulp of contained and diffused silver-amalgam by the use of sodium-amalgam would alone give it an obvious importance; but it has other values when properly understood. Kustel's experiments having been based upon an incorrect idea of the mode of action, have but little applicability *pro or con*, and inconsistencies were pointed out in his conclusions. Kustel's conclusions that iron pans cannot be used with sodium, for instance, is shown to be fallacious by very numerous working results now on record. In any case it is fortunate that one negative result has little weight against concurrent positive results of many others. Mr. Kustel, however, admits the value of sodium for gold ores, and others in California experienced in amalgamation, do not concur with Mr. Kustel in his opinion with regard to silver ores.

[The objections of Mr. Kustel, above referred to, were originally published in the MINING AND SCIENTIFIC PRESS of November 18th, 1865, and March 31st, 1866. We presume that Mr. K. will be abundantly able to sustain himself in his objections.]

As was to be expected, there are in England also those who cavil at the "new fangled" method. One correspondent of the same journal objects, partly on the ground that the "sodide of gold" has not yet been discovered. Another orally writes that "the sodium process is alike unphilosophical and commercially impracticable." Some words were devoted to the conflicting claim to priority of discovery which was entered by Mr. William Crookes, one of the most learned, industrious and successful of English scientists. The graceful concession of this point, which Mr. Crookes is considered of late, both by scientists and jurists, to have made, by his own silence and by publications in the journals ostensibly authorized by him, it is thought will not prove any appreciable detraction from the laurels so well and worthily won by him in the field of chemical discovery.

ITS AUTHENTICITY AS A MODERN DISCOVERY CONSIDERED.

The most surprising articles elicited by this discovery, in transatlantic journals, have emanated from certain persons who have denied the authenticity of the discovery altogether, and claimed that the use of sodium in amalgamation of ores has already actually been a matter of publicity for centuries. Mr. John Calvert and another writer (anonymous) have put forth the astounding assertion that extracts can be "given from more than 100 works in various languages," showing that not only sodium but magnesium has been used in this way from time immemorial. Three works, are referred to by name—Schwartz's "Alchymia de Salibus," Alvaro Alonzo Barba's "Art of Metals," and Roger Bacon's "Ars Omnia." Schwartz's book probably does not exist upon this continent, but Prof. Wurtz has been so fortunate as to find a copy of the very edition of Barba, referred to, in the hands of Prof. George J. Brush of Yale College, who kindly lent the precious volume, and he exhibited it to the Section. As could have been anticipated, there is nothing in it indicating, in the remotest manner, a knowledge of sodium, much less of its use in amalgamation. Prof. W. expresses his surprise, however, to find that at

the time this book was written, in 1640, almost every refinement in the art of amalgamation, and in other branches of gold and silver metallurgy practised at the present day, excepting the use of sodium (and not excepting many supposed to be of modern origin) was known and used by Barba and his contemporaries. As regards the still more ancient work of Schwartz referred to, Prof. W. thinks it may be said with reason that a person of lively imagination could find plainly set forth, in the jargon of alchemists, every one of the discoveries of the nineteenth century, beside a multitude of other discoveries, either yet to be made or never to be made.

The third work named, that of Roger Bacon, it appears has never been published, but exists according to Mr. Calvert, as a manuscript of immense magnitude; from which he copies the following from a passage on "The Metal of Salt," under the heading of "The Magic of Salt:" "It is well that the vulgar understand not the good and great art of salt, as if it were known to all, riches would no longer be held rare, or even respected, as with this metal much gold can be obtained, and such great virtue doth it contain, that one piece of such size that will cover the top of the small finger, will work wondrous magic throughout a great mass of such worthless stuff that no man would buy for the smallest coin; yet when this and other metals well known to all men, shall lovingly and speedily unite in one common mass, then the adored of all metals becomes life, and is born unto man, and true and real gold may be taken from those common metals without loss to them in weight or virtue, so that by great craft, cunning and magic, not enjoyed by common men, good gold, never again to be lost, is transmuted from the vilest of dross; and so men may enjoy riches without prying into others money-bags or borrowing from those who have little to lend."

This is, of course, set forth by Mr. Calvert as his own translation of the original Latin manuscript, and is interpreted by him as relating to the extraction of gold from ores by amalgamation; but Prof. W. denies the possibility of any such interpretation, regarding it rather as describing merely one of those obscure and apocryphal methods of transmuting other metals into gold, in which the alchemists so abound, and he suggests that even were it an unmistakable description of the use of sodium in amalgamation, it would still have no bearing whatever on the question at issue, not being cited from a published work, but from one which has probably been as much concealed from the public eye as if it had been newly exhumed from the catacombs of Egypt.

ITS EXPLOSIVENESS CONSIDERED.

The last branch of the subject touched upon related to the very recent and wonderful announcement from an unknown source, so widely and persistently paraded in the public press, of the amazing *explosiveness* of the amalgam of sodium; one of the most prominent of the New York dailies having, for example set forth in a leading article, that while metallic sodium is a "harmless substance" (an erroneous statement so very grave and fraught with danger as to be inexcusable even of the plea of ignorance) on the other hand, "the terrors of nitroglycerine itself dwindle into insignificance when compared with those of the new compound termed sodium amalgam," and that "one ounce of sodium amalgam is equal to twenty-five pounds of gunpowder," and similar rubbish *ad nauseum*. With regard to this latter comparative statement Prof. W. remarked, that, according to this the samples of sodium amalgam lying on the table before him were equal to six tons of gunpowder, and that he had often made with his own hands, and in one operation, in one day, a quantity equal to 100,000 pounds of gunpowder. His chief object in even alluding to a matter which he was aware was to a chemist merely

"A thing for laughter, flcers and jeers."

was to explain the cause and origin of such a fantastic and apparently puerile hoax. It was simply an ingenious but futile *commercial trick*, the motive for it having been the hope of embarrassing the transportation and introduction of amalgams of sodium into the mining regions by those legitimately entitled to introduce it, until the completion of certain arrangements for infringing upon the patent rights that have been granted by the United States in the premises.

In the course of Prof. Wurtz's remarks, he was interrupted by questions from Prof. Stoddard, Perkins and Hadley.

At the conclusion of the paper, Dr. President Barnard remarked that he felt great interest in the discovery made by Prof. W., and thought he might be regarded as one of the benefactors of the world in making two grains of gold available where there was but one before.

In response to an inquiry, Prof. Wurtz said that the discovery would lead to an extensive development of the manufacture of sodium, aluminum, magnesium, calcium, etc.; to render them cheap and useful metals in the arts.

Mechanical.

IMPROVEMENTS IN THE MANUFACTURE OF IRON AND STEEL.

There seems to be no limit to the improvements which are being introduced to cheapen and improve the manufacture of steel. The success of Mr. Bessemer appears to be the initial from which most of the later improvements take their start. His process has supplied the required clue, and has given us the raw material at a price so greatly reduced from its former cost, as to lead to the impression that steel must soon become an almost universal substitute for iron. Several individuals have taken up the process where Mr. Bessemer left it, and, by subsequent manipulation, have greatly improved the quality of the steel. Messrs. Brown & Co., of Sheffield, England, have recently been conducting some extensive experiments in this direction, the results of which are considered of great importance. Those gentlemen take the Bessemer ingots, re-heat them and put them through a process of rolling and hammering, which adds vastly to their strength. This process may be carried to a greater or less extent, according to the purposes for which the iron is wanted. To form a cylinder for a heavy gun, for instance, the hammered mass of iron is subjected to the additional process of a further condensation, by the use of a punch, made to move rapidly outward from a point equidistant from the extremities. A mandril is then inserted, and the mass is elongated by being forced through rolls to carry still further the process of condensation, and impart to the steel a superior quality of metal and accuracy of dimensions. Of course the various manipulations involve a large amount of labor; but for specific purposes, such as for the manufacture of rifles and heavy ordnance, the increased strength and solidity imparted to the iron, added to the diminished weight, is considered a fair equivalent. The process is about to be applied to 7-inch ordnance. It has already been applied to hollow marine and other shafting, railway and other axles, locomotive and other boiler tubes, etc., where great strength with small weight is an important desideratum. The results thus far are reported as having been exceedingly satisfactory.

Another improvement has been announced in the manufacture of iron, for which a patent has been taken out by Mr. John Onions, of London. This iron is said to be made of ordinary pig-iron, and manufactured at a cost of twenty-five per cent. under that of charcoal iron, and is its equal in every respect, as regards quality. Samples have been in various hands for trial, and uniform success has been the result. The process by which this result is obtained is not given.

THE PRODUCTION AND CONSUMPTION OF IRON IN THE UNITED STATES AND ENGLAND.—The United States Bureau Commission have laid before the Secretary of the Treasury a report in relation to the iron interest of this country, which contains much valuable information. From this report it appears that the United States has been, since 1830, the largest consumer of iron of any nation in the world. England produces the most iron, but exports more than she consumes. In her manufactures for export and home use, she employs 160 pounds per head of her population—her home use does not exceed 80 pounds. The home use for the United States is about 130 lbs. per head, about one-fifth of which is imported. Our natural facilities for the production of iron and steel are not surpassed by those of any country in the world, and we are fast increasing our capacity to take advantage of those facilities. At our present rate of progress, we shall soon become the largest producer, as well as consumer, of iron in the world. The commission reports that in the manufacture of steel, our country has nearly emancipated itself from dependence on others. The American cast steel has been tried throughout all the manufacturing States by the most skillful manipulators of fine cutlery, tools, and both heavy and delicate machinery, and the evidence of its excellent quality is beyond dispute.

THE CRANK MOTION.—An erroneous impression prevails with many that there is a great loss of power in converting rectilinear into rotary motion by means of a crank, as in the case of the steam engine. When the crank of a steam engine is at right angles with the connecting rod, it is claimed that the power of the steam is exerted with the full advantage of the crank acting as a lever to turn the shaft; but when the engine is near its center, with the crank nearly parallel with the connecting rod, the power of the steam seems to be applied to a great disadvantage, and hence the idea of the loss of power as above. In examining this matter, it should be observed that when the crank is at right angles with the piston, a movement of the latter through one inch of stroke will move the crank but about one inch; but when the crank is nearly in line with the piston, a movement of the latter of only one inch will move the crank several inches. Hence, in this as in other mechanical movements, what is lost in power is gained in time. Diagrams have been constructed which prove, by mathematical demonstration, that a given amount of steam will do quite as much work in one part of the stroke as in another. In passing the centers, an inch motion of the crank is effected by a very small motion of the piston, which latter is produced by a corresponding small expenditure of steam. This expenditure is sometimes so small as to be unable to overcome the friction and resistance, in which case the engine stops—not from the loss of power expended in converting the rectilinear into rotary motion, but in consequence of the small amount of steam which can be brought to bear in producing the increased motion of the crank with the decreased motion of the piston.

A FRENCH "WOLFE" ENGINE.—Mons. P. Vabe has got up an engine with two pistons on one rod, on Wolfe's principle. Steam is distributed by one valve. He claims that the steam in the large cylinder, whose area is double that of the small one, is as effective as it has been in the small one; that is, the effect of the steam is doubled. There are many experiments on this kind of engine, indicating that the high pressure and low pressure engines, with the aid of surface condensation, are likely to work together; provided, of course that the theory of the expansionists be not proved false, and that of the non-expansionists confirmed by these numerous experiments. We confess our faith in the utility of expansion, and believe that when locomotive-boilers and engines are put on board ship, and exhaust into low pressure boilers, there will be a great saving of fuel.

A PROGRESSIVE ENGINEER proposes to connect New York with Jersey City by a cast iron tube laid in the bed of the river, five feet in diameter. The tube is to be cast in lengths of twelve feet, with spherical joints to allow for change of position, and is to be worked by the pneumatic method, for the purpose of transporting the Erie Railroad's freight from Look Dock to the Duane street pier, in New York. The plan is said to be perfectly feasible, while the principle is one that can be advantageously applied on a larger scale. All the railroad lines diverging from New York will eventually enter it under ground, and concentrate in a single subterranean depot. Access to this will be much the most cheaply and expeditiously attained by the New Jersey and Long Island railroads, through tubular iron tunnels, laid on the beds of the Hudson and East rivers.

A NEW METHOD TO AVOID BOILER INCrustation.—An apparatus has been invented to prevent the incrustation of boilers, which is certified to have perfectly succeeded. It proceeds upon the principle of the inversion of the galvanoplastic process, in which metals are made to adhere on proper surfaces, by deposit from the solution. In this arrangement the galvanic effect is repellant and prevents the adhesion of particles.

The largest mass of rolled iron exhibited in the London Exhibition of 1851, weighed one ton and a half, and this was considered extraordinary. In the Exhibition of 1862, the heaviest specimen weighed no less than thirteen tons.

At the Universal Exposition of 1867, Napoleon and the Empress Eugenie, will figure as exhibitors of workmen's houses, and may be fortunate enough to carry off a medal.

Scientific Miscellany.

ATMOSPHERIC WAVES.—Prof. C. M. Hough of the Dudley Observatory, described at the late meeting, at Buffalo, of the American Association of Science, a very sensitive, automatic registering barometer constructed by him, which accurately records fluctuations of the barometer down to one-thousandth of an inch. By the use of this instrument, he has been enabled to make some most interesting observations with regard to the movement of storms and winds, and the ordinary action of the atmosphere. This sensitive instrument records the most minute pulsations of the atmosphere. By it he has been able to prove that there is a great similarity between atmospheric waves and the waves of the ocean, and that the atmospheric waves exhibit much of the same regularity and phenomena as do those of the ocean. He has been enabled to detect in the atmosphere similar movements to the great ocean swell, with smaller waves or ripples moving independently upon the larger waves. These atmospheric waves are of vast extent and height. One of these sometimes reaches over a vast extent of country. For instance the barometer may be highest at St. Louis, with a gradual depression shown by intermediate points of observation, until the lowest point is noticed at New York, showing that the crest and depression of the wave are separated by a thousand miles of space! His barometer is never at rest; it is constantly rising and sinking. Prof. Tillman, after expressing his enthusiastic admiration of the instrument of Prof. Hough, suggested that the atmospheric waves described by the latter might possibly be waves of density and not waves of form.

The extreme compressibility of the atmosphere, and the fact that the disturbances thereof must have their origin in its lowermost regions, would seem to lead to the inevitable conclusion that variations of density must certainly form the most important element in the fluctuations of the barometer. Atmospheric waves, with the exception of those of a tidal character, must be wholly produced by local compressions near the earth's surface; in fact we do not see how they can be waves at all, in the proper signification of the term. They must be mere protuberances, resulting from compressions below—analogueous to a disturbance of water from an underneath or outside influence, and not from an aerial action upon its surface.

PHOTOGRAPHING CANNON BALLS.—To such perfection have the mechanical appliances and chemical action of photography been carried, that the image of a cannon ball has been caught and fixed, so that the projectile could be seen protruding from the cannon's mouth, partially concealed by the gun, while in the act of proceeding on its mission. This fact has recently been communicated to the British *Journal of Photography*, the editor of which periodical was shown several photographs of this description at the Woolwich Arsenal, England. The gun itself, by the aid of nicely adjustable machinery, aided by electricity, was made to expose and cover the sensitive plate. Such an act would, of course, be entirely beyond the capacity of the most delicate eyes and ears to accomplish. The entire process is fully described in the above mentioned journal.

INTERESTING FOSSIL DISCOVERY.—An interesting fossil discovery has been made in the Upper Wenlock shale of Dudley, England. Mr. L. P. Capervell has found a very perfect specimen of *Goniophyllum pyramidale* in this deposit, the first occasion in which this fossil has been found in British Silurian strata. It has been identified by Herr Lindstrom, the celebrated author of the "Zoantharia Rugosa."

IODINE A SOLVENT FOR GOLD.—We mentioned some time ago the discovery by N. Nickles, of some new solvent of gold, among which was nascent iodine. Mr. Nickles has now found that iodine, when not in the nascent state, will dissolve gold, when aided either by pressure or the influence of sunlight.

HOW TO RENDER PHOTOGRAPHS INDESTRUCTIBLE.—The cause of the destruction of photographs, apparently by the action of time only, is generally considered to be due in reality to the presence of a minute quantity of hyposulphite of soda. Hitherto the only plan of getting rid of this agent has been long and continuous washing in hot and cold water. Dr. Smith suggests oxidizing the hyposulphite of soda into sulphate of soda (which is harmless) by dilute peroxyd of hydrogen. The strength of the solution does not require to be great. If diluted a thousand times, a solution is obtained capable of oxidizing hyposulphite. It appears all the hyposulphurous acid is instantly converted.

AN AMALGAM OF MAGNESIUM may be formed by heating quicksilver in the presence of magnesium, which will oxidize with wonderful rapidity, decomposing water with the evolution of hydrogen gas. This result is accomplished when but a very small percentage of magnesium is present. This fact, we believe, is quite new; at all events it was recently announced in the proceedings of the Franklin Institute. This amalgam, it will be perceived, is quite similar in its action upon water, and in its affinity for oxygen to the sodium amalgam, now so general known among miners, as a medium for saving the precious metals.

SCIENTIFIC FACTS.—The violence of the expansion of water when freezing is sufficient to cleave a globe of copper, of such thickness as to require a force of 28,000 pounds to produce a like effect.

Heat rarifies air to such an extent that it can be made to occupy 5,550 times the space it did before.

The explosive force of close confined gunpowder is six and a half tons to the square inch.

Water, when converted into steam, increases in bulk 18,000 times.

During the conversion of ice into water, 140 degrees of heat are absorbed.

The greatest artificial cold ever produced is ninety-one degrees Fahrenheit.

THE SPHYMOGRAPH is a new and ingenious invention for registering the human pulse. The short arm of a tight lever is applied to the pulse, and at the end of the long arm is a very delicate pencil, which passes over a roll of paper, the roll being moved by clock-work. The result is a wavy line, which differs according to the age and condition of the patient and shows, clearly, phenomena which would otherwise escape observation.

BLEACHED INDIA RUBBER.—A process has been discovered of bleaching India rubber so as to make it perfectly white, and when hardened it can be manufactured into collars and cuffs. The process is a chemical one, but the fumes of the drugs used are so fatal to the workmen engaged, that they have to be encased in armor, and are supplied with pure air by means of pumps, the supply being drawn from other apartments than the one in which they work.

SINGULAR FACT IN TELEGRAPHY.—A correspondent of an English paper, speaking of the Atlantic cable, says that from daylight till 2 o'clock in the afternoon the cable generally works with great difficulty, after which time the working grows easier and more rapid until dark, and all through the night it works easily and well. The editor of the *Telegrapher* has often noticed this fact on land lines.

THE EYE OF A FLEA.—Puget succeeded in adjusting the eye of a flea, so that by using a microscope he was able to see objects through it. It diminished the size, but at the same time multiplied every object. For instance, a soldier appeared like an army of pigmies.

A NEW MINERAL, to which the name of laurite has been given, has lately been found in Bordeaux, and a description of it laid before the Paris Academy of Sciences, by M. Wohler. It is found mixed with the ore of platinum, and occurs in the form of small globules, not above half a millimetre in diameter.

THE DIAMOND EXCEEDS.—The crystallized protoxide of copper, recently found in crystals transparent to red light, in Chessy (Rhône) is said to far exceed in refractory power even the diamond. M. Fizeau has recently shown that both expand under heat.

MR. AMY assents to De Celamy's opinion that the apparent acceleration of the moon is due to real retardation of the earth, arising from friction in the tidal movement of the waters.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, Sept. 29th, 1866.

The Money Market presents no new features worthy of especial note. There is a slight augmentation of deposit balances in some of the banks, and we hear of less stringency in many quarters, although the demand continues active upon prime paper and other first-class securities; at 1@1½ cent. per month. Little or no difficulty is experienced in mercantile circles in obtaining all the facilities required for legitimate business purposes, and the merchants generally are in a sound and healthy condition. There is considerable doing in Real Estate, and an unusually large number of first-class improvements are vigorously under way in different portions of the city. For these purposes money is readily obtainable at low rates of interest.

Receipts of Treasure from the interior are about up to the usual average, and during the current month amounted to some \$4,000,000. The Sub-Treasurer, in this city, shipped East, on Government account, \$500,000, by the steamer St. Louis, making an aggregate of \$8,500,000 thus far since January 1st.

Bullion is meeting with rather more inquiry, and it is believed that important shipments of Silver Bars will be made to China by the two vessels now loading at this port. Gold Bars are a shade better at \$40@845, and Silver is quotable at about 1½ cent. discount for round lots.

Currency Bills on the Atlantic cities are offered at 39@39 cent. premium on Gold. Sight Drafts, payable in coin, are selling at 2¼ cent. premium, and Telegraphic Transfers are made at 3 cent. premium. Sterling may be quoted at 48½@49d. for best Bankers' Bills; Commercial do. at 49½@50d.

Our latest telegraphic advices from the East, to the 27th inst., quote Gold at 145, and Sterling Exchange at 108@108¼.

City Stocks have been dealt in to a limited extent during the past week. Steam Navigation Company sold at 72½ cent., or \$725 per share of \$1,000, and closed yesterday at 71 cent. bid. National Insurance Company commanded \$76.50 per share; at the close we quote it at \$76, bid. We quote San Francisco Gas Company at \$140; Spring Valley Water Company at \$62; and State Telegraph at \$32.

At a meeting of the stockholders of the California Steam Navigation Company, held last Saturday, it was decided by an informal vote—no quorum being present—not to increase the stock of said company from \$2,500,000 to \$5,000,000. Unanimity prevailed in regard to re-issuing the shares at a \$100 instead of \$1,000 as at present. This will place the shares much more advantageously in the market, allowing persons of limited means to invest.

We note the formation and incorporation of the Builders' Insurance Company with a capital of \$50,000, divided into 500 shares of \$100 each. The business of this Company will be carried on in connection with the California Building and Loan Society. Thomas Mooney, Nathaniel Page, and others, are the incorporators. This makes the eleventh on the list of home insurance companies now in existence in this city.

The Mining Share Market has continued in a very inactive condition during the period under review. This flat and dormant state of the market has prevailed for a month or more past, and recent developments in the great Comstock lode have not, to any degree, added buoyancy to the market. Operations are steadily and vigorously prosecuted on nearly all claims now quoted in the Board, and an improve-

ment, it is hoped, will manifest itself before many weeks. Lack of accommodations in the money market may, to a great extent, be cited as a cause for restricted speculative transactions; and, as for permanent investment in this class of securities, the market may be said to be bare. The sales in the Board, with few exceptions, are now confined to shares of companies located on the Comstock vein.

The firmness with which Hale & Norcross is held is a sure indication of the usual steady yield of this mine. No sales have been made in the Board during the past month. We quote it at \$1,800, asked.

Savage opened at \$1,110@1,128, buyer 30, declined to \$1,105, and held yesterday at \$1,115. This mine has not been worked to its full capacity for some time past, partly on account of the scarcity of teams to remove the metal and the crowded state of the company's ore houses. Little ore has been extracted from the richest breasts. The 4th and 5th stations of this mine have improved materially during the week ending Sept. 22d, producing more and a better quality of ore. The yield from the south breast of the Curtis shaft is steadily increasing. In the north drift of the Curtis shaft ore of a medium quality, which is improving daily, was reached at a distance of 200 feet south from the south face of the sixth station. During the week ending Sept. 22d, 824 tons of ore were extracted, the estimate value of which is given at \$30,440. The estimated profits stated in our last issue were the result of only four days' work.

Crown Point remains quiet, changing hands at \$870@900, seller 3, and at the close is quoted at \$875. Good ore has been found in the 400 foot station—lower level—with fair prospects of an improvement in the quality by further developments. The estimated yield of bullion for the present month may be stated at about \$110,000. The receipts of bullion to the 25th, have been \$72,000. During the week ending Sept. 23d, 642 tons of second-class, and 5 tons first-class ore have been raised from the mine.

Gould & Curry shows a slight improvement, without any special inquiry; only a few feet were sold during the past week, opening at \$600, then selling at \$610, and closing at \$610, asked. The search after increased deposits of ore has not, up to this time, proved successful; otherwise the mine remains in good condition.

Yellow Jacket has been largely dealt in during the past week, opening at \$700, dropping to \$635, rallying to \$672.50, and closing yesterday at \$682. During the week ending Sept. 24th, some 6 tons of first-class, and 1,854 tons of second-class ore have been extracted from the mine, and the total yield of bullion for this period exceeded \$61,500.

Ophir receded from \$207.50 to \$197.50, seller 30, then sold at \$200, seller 10, and closed at \$207, asked.

Chollar-Potosi opened at \$115, advanced to \$121, seller 3, receded to \$107, then sold at \$110, seller 30, and closed yesterday at \$110. The work on the new shaft, in all the various stations, has been again resumed, and so far no important developments have been made. In drifting north on the 1st station, a narrow belt of quartz, some 18 inches wide, has been encountered. This is considered a favorable indication of obtaining ore as further progress is made. During the week ending Sept. 22d, some 627 tons of ore were shipped to Custom Mills.

Imperial improved a little during the week, opening at \$81@80, advancing to \$84, and selling yesterday at \$82. During the first three weeks of the present month, some \$40,000 in bullion have been received. The mines of this company, we are informed, are being well developed—some estimate the amount of ore in sight in the several stations to be sufficient to supply their present reduction capacity for eighteen months to come.

Belcher fluctuated between \$110@93, and closed at \$94. Empire Mill sold at \$80, buyer 30, during the week. Confidence changed hands at \$55, buyer 30. Bullion at \$16; and Overman within a range of \$20.50@16.25—assessment of \$15 on.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday, amounted to \$413,430.50.

A Hint to Advertisers in General, and San Franciscans in Particular.

The following article from the *Mountain Messenger*, published in Downsville, the county seat of thirty Sierra, illustrates an important fact which some people are prone to overlook, viz: that it is not the lowest priced advertising which is the cheapest. For instance, an advertisement inserted for \$30 in a journal issuing 3,000 copies, is twice as cheap as at \$20 in a paper having only 1,000 circulation:

Judicious Advertising.

It is passing strange how few business men in the cities of this State understand advertising judiciously in the country press, whether making their arrangements with the publishers or their agents in San Francisco. There are five different agencies which receive advertising for the country papers of the interior, only two or three of which are able to secure an agency for first-class papers, such as have an extensive circulation and established rates of advertising, from which they decline to vary at the option of the advertiser. These papers are usually full of advertising at fair rates, only a trifle in advance of papers having a very limited circulation. The other agents and publishers have no established prices, and consequently overcharge if they have an opportunity, but generally take advertising at about twenty per cent. less than usual rates; and the foolish advertiser who gets his advertisements into a score or two of these journals doubtless thinks he is advertising judiciously and cheaply, when in fact he is paying the very dearest price, considering the limited circulation his advertisement obtains. Thus, many business men, though they doubtless find it pays to advertise, even in this class of papers at this low rate, are advertising injudiciously and paying double rates for the circulation they desire to and might obtain by advertising in first class papers, the rates of which are but a trifle higher than those which advertise for such prices as they can obtain. These low price advertising agents work an injury to both publishers and advertisers, and are rarely able to liquidate when the quarterly settlement is due, and their names are bandied about through the press with epithets of well merited contempt.

While the penny-wise style of business referred to pays one class of advertisers very well, it works injury to others who fail to obtain the value of their money. There is hardly any kind of trade extensively carried on in San Francisco that will not pay to advertise throughout the State, to the mutual benefit of the advertiser and publisher; but a want of general information concerning the amount of trade to be expected has established a want of confidence to try. Advertising in the East is more general because statistics of trade and its profits prove its value, almost without trial. The inducements to advertise in this State are no less, as we propose to show by reference to the consumption of goods in this country.

From the Auditor's office we learn that there are no less than two hundred licensed retail dealers in Sierra county, whose annual sales in the aggregate foot up the handsome sum of \$3,500,000, and it is to be presumed that some of these dealers have overstated their sales. To this amount may be added \$1,500,000 worth of goods purchased on private account for miners' winter stores, and for the supply of incorporated companies and quartz mills, making in total a valuable trade of about \$5,000,000 annually.

The wealth and population of a section, and the influence and circulation of an old established paper, determine its value as an advertising medium—a matter never lost sight of by an experienced advertiser.

The *Messenger* is one of the oldest and best established papers in the State, and has always enjoyed an extensive circulation (wholly unaided by party contributions) equalled by no other in this locality at any time during the last ten years, and has entered upon its thirteenth volume with increased subscriptions and extended advertising patronage. It has been twice enlarged since its removal from La Porte to Downsville, in 1864, and now presents more reading space and type than any other weekly local journal in the State (not connected with a daily issue), and more local matter. No business man is without it, and its circulation extends throughout the mines in all the different camps of this county and vicinity, as follows: Forest City, Alameda, Chiles, Flat, Minnesota, American Hill, Sierra Valley, Downsville, Goodyear's Bar, Cliftonville, Eureka, Port Wine, La Porte, Sawpit Flat, Gibsonville, Newark, Plover Flat, Howland Flat, Pine Grove, and St. Louis, besides many other smaller camps.

The *Messenger* has an extensive job office, and does the printing and advertising of the county.

REMINGTON'S ARMORY.

Agency, 310 Washington St., San Francisco.

PRICES REDUCED!

These arms have been preferred by the United States Government, and stand unequalled by any in the world. Revolvers, Army, Navy, Belt and Pocket, Double and Single Action. Repeating, and vest-pocket Pistols, with copper ammunition; Police Revolvers, a new model, navy size, 4 1/2 to 6 inch barrel; Rifle Guns—an entirely new model, having a range and accuracy equal to a rifle, and a most perfect Ounce. All the new models for sale very low.

Endorsement by the Miners' State Convention

The following resolution was adopted by the California Miners' State Convention, held at Sacramento, Jan. 17th, 1866:

Resolved, That we regard a mining paper or journal of great importance to the mining interest of California, and we recommend the MINING AND SCIENTIFIC PRESS, of San Francisco, to the consideration and support of the miners of the Pacific coast.

RUGGLES' PRINTING PRESS.

For Sale or Exchange.

The Proprietors of the MINING AND SCIENTIFIC PRESS have on hand a Half-Medium Ruggles Engine Job Press, in condition good as new; which will be sold cheap, or exchanged for a good Hand-Press of medium or large size.

DEWEY & CO., Job Printers,

Office, 505 Clay street.

OUR NEW YORK AGENCY.

Mr. GEO. M. NEWKIRK is our authorized agent in New York City, and will receive advertisements and subscriptions for the MINING AND SCIENTIFIC PRESS at regular rates. Sample copies of our weekly and monthly issues can be procured by calling upon him, at the office of the "STOCKHOLDER," No. 75 William street.

Commencement of Twelfth Volume

—OF THE—

Mining and Scientific Press

Published Every Saturday.

The title of our journal is a truthful expression of its character.

It affords a class of progressive information to the Miners, Mechanics and Professional Men of the Pacific Coast, which cannot be derived from books, or other publications.

Each Volume comprises, in reality, a book of new intelligence and facts relating to Mining, Mechanism, Metallurgy, Science and Art, developed by our rich and peculiar resources, and identical with our own industry and history.

By the encouragement of intelligent economy in LABOR AND GOLD-SAVING, we shall make the PRESS a source of INDIVIDUAL PROFIT to its patrons, as well as a public benefit to every local community in which it circulates.

The prospects of our journal are now brighter than at any former period. Our facilities for furnishing a valuable paper are constantly increasing.

Following are some of the many opinions generously expressed by our neighbors:

Editorial Expressions:

VOLUME TWELFTH.—THE MINING AND SCIENTIFIC PRESS with its last issue, commenced its twelfth volume. Since Dewey & Co. have held the reins, its life has been rapid toward a perfect journal. Its appearance evidences its prosperity, but doubtless, like some of the rest of us, it can stand increased encouragement. Let such be given, and, our word for it, volume thirteen will acknowledge receipt.—[Golden Era.

MINING AND SCIENTIFIC PRESS.—We received a visit a few days since, from Mr. W. Wood, agent for the Mining and Scientific Press, who is now canvassing this country for subscribers to that valuable journal. The Press is valuable to miners and mechanics, being the only journal of any importance on the coast entirely devoted to their interests.—[Mountain Messenger.

We can give our testimony that it is always replete with useful and valuable information to miners and mechanics. [Placer Herald.

The publishers intend to make it the "Scientific American" of the Pacific Coast. Every miner should have a copy of it in his cabin, for it will be filled with useful information to the pick and shovel fraternity.—[Tribune Journal.

It contains correspondence from different sections, giving accounts of new discoveries in gold, silver and copper, and should be taken by every person that wishes to keep well posted on the developments of our State and the Territories.—[Mountain Messenger.

With the last number is an index to the whole volume, most useful and valuable to those who keep files of that paper.—[Shasta Courier.

Prof. J. D. Whitney's address on Mining, is given entire. * * * We preserve the Press, and would like to have a full file.—[Napa Reporter.

THE MINING PRESS is particularly the miners' journal, and is doing more for the solid interests of the State than any other, by enabling its readers to unlock the mines of untold wealth which lie waste around them.—[Mountain Messenger.

The public should support the enterprise of the MINING PRESS, one of the best papers in the State, by a liberal patronage, as it is only by a system of legitimate reports that our mines can be favorably brought before men of capital below.—[Calaveras Chronicle.

Under the management of Messrs. Dewey & Co., the Press has been much improved in every respect. * * * It deserves a liberal support.—[Virginia Union.

A good paper for this country.—[Humboldt Register Na.

Those who would have a good paper of this character should subscribe now.—[Marysville Appeal.

Mining Summary.

CALIFORNIA.

Alpine County—

From the *Miner* of Sept. 22d, we clip the following: In the Schenectady, the week has been principally occupied in clearing out the old tunnel and getting ready for operations in the face. Six men are at work.... In the American, the vein of gray and black ore is from ten to twelve feet in thickness. Assays of the ore vary from \$56 to \$128 per ton.... It is believed that work will soon be commenced on the I. X. L. claim.... Most of the machinery for the mill at Davidson's has arrived.... Some time since a claim was located on a ledge lying four or five hundred feet east of the Buckeye No. 2 and called the Accacia. Mr. O. F. Thornton, in examining this lode, recently found some very fine specimens of quartz, bearing ruby silver and nitargyrite in large quantities, one sample assaying over one hundred dollars per ton.

In Silver Mountain district, the contractors on the Kohinoor yesterday struck a stream of water and are apparently in close proximity to the ledge.... The Washington company are pushing ahead on their ledge and taking out some very fine ore.... Work has been resumed on the Balaklava.... The Mountain, Pennsylvania, Buckeye No. 2, X-10-U-8, Maine and Olive Branch are all working.

The New York purchasers of the James Barrett company's lodes will soon open them.

The Silver Mountain *Bulletin* of same date says: The Maine company cut their ledge last week, but the point intersected being immediately under the bed of a ravine it was somewhat broken up. We learn that they will commence drifting south in a few days.... Two shifts are being worked in the George Washington claim, taking out pay rock. The ledge is increasing in thickness, and the ore in quality as they penetrate the mountain. The lower level is at a depth from the surface of about two hundred feet.

Amador County—

The *Ledger* of the 22d inst., has the following: The owners of the William mine, near Sutter Creek have, at last, been rewarded for their perseverance—they have found a lode that pays ten to twelve dollars a ton.... Billy Smith & Co., on the first north extension of the Union mine, are now down sixty-five feet, have a large vein, and a recent crushing paid eight dollars.... The My Mary Ann Co., at Pine grove, cleaned up a run of forty odd tons, the other day, that paid nearly sixteen dollars to the ton.... The Union, near the same place, have again resumed operations, and will sink their shaft fifty feet deeper.... The Paugh lode is looking fine. The shaft is now down below a permanent water level—ninety-five feet—and the ore looks better than ever. The mill will be ready for work the coming week.... The Independent is the name of a new mine between the Paugh and Clinton. The main shaft is down about eighty-five feet, and some of the rock appears well.... The Anaconda, Golden Eagle, Italian, and others, are all in a prospering condition, yielding an abundance of free ores.... The Railroad, at Sutter, has fulfilled all our predictions. Shares are now worth only ten thousand dollars. Extensive steam hoisting works are under way.

Eagon & Co., of Fiddletown, have commenced work on the old Slaughter House Gulch lode, long since abandoned by the original owners, and are taking out exceedingly rich quartz. They are now hauling rock to the Richmond mill for the purpose of having it crushed.... In the Newton mine, last week, at the depth of two hundred and fifty-five feet, in the lower tunnel, they struck a vein of exceedingly rich ore, six feet wide. The owners, C. T. Meader & Co., have erected steam-hoisting works on the mine, and are taking out large quantities of ore which is shipped to San Francisco. Quite a town is growing up in the vicinity of the mine.

Butte County—

The *Record* of Sept. 22d, has the following items: The wing dam of J. Clark & Co., on Feather river, near White Rock, is proving very rich, yielding as high as 25 and 30 ounces of dust per day.... We understand that a ledge yielding some excellent surface quartz, has been found near the Buffalo ranch, in Wyandotte township.

The *Appeal* of 25th, says: Mr. Kneeland, Superintendent of the quartz mill on the Sherman ledge, near Oroville, exhibited to me on Saturday several very rich specimens of quartz rock.

Humboldt County—

The *Times*' correspondent of September 15th says: Mr. John V. Hunter has returned from San Francisco with orders to resume operations at the Davis well, and is now engaged in erecting more substantial machinery for that purpose. Work will doubtless be continued here as long as they have any indications whatever of oil.... Mr. Wentworth has purchased the machinery of the Jeffrey company.

He will now commence operations in another locality.... Work will be suspended at the Fenner Farm well after to-day, for a short time, in order to get machinery. It has attained the depth of 300 feet—indications excellent.

A meeting was called of all citizens interested in the Humboldt oil matters, the object of which was to consolidate interests, and organize for a thorough test for oil.

Kern County—

The *Havilah Courier* of 22d says: The Pioneer mill, which has been idle for the last two weeks, commenced crushing rock on Monday last. Messrs. Taylor & Erskin now have an interest in the mill. They crush rock from the Uncle Abe ledge, and will shortly operate on that from the Boomerang.

Mr. John F. Tulley and friend struck a very rich vein of quartz, not long since, in the new Washington district, on Kern river. They have already taken out a dozen tons of what is pronounced "hundred dollar rock," which will speedily be run through an arrastra.

Los Angeles County—

The *News* of September 21st has the following: Accounts from San Fernando and vicinity continue to be of the most flattering character, as regards both yield and quality of oil. The Pico Springs, under the superintendence of Mr. S. Lyon, are giving the most satisfactory results. Mr. M. F. Hughes, of the San Fernando Petroleum company, has bored to the depth of about 200 feet, and is obtaining a constant increase of fine oil. The Moore Springs are also progressing finely. The Wiley and Tousey works are fairly overflowing, on account of the lack of barrels and capacity of means to contain their yield. * * * Mr. R. G. Surdam, at Wheeler's camp, near San Bucna; Ventura, writes that the Philadelphia company are employing over twenty men, and want more hands. The works are now producing forty barrels daily.

Nevada County—

The Grass Valley *National* has these items: The Ophir company are now working in their third level, which strikes the old shaft at a depth of 570 feet, struck their ledge the other day in the level and found it to be two feet thick. Several candle boxes of very rich specimens were taken out, and, in fact, all the rock at this point shows well.... The Inkermann ledge is producing at present some very pretty rock, which yields by crushing \$20 per ton. The ledge is now being worked at a depth of only fifty feet from the surface, and is visible the whole length of the tunnel, which is now in some 375 feet. The ledge varies from six inches to two and a half feet in width, and rock taken from any portion of it shows more or less free gold.... Some fine specimens were recently taken from the Old Collins claim, near Boston Ravine.

The *Gazette* has this item: The engine and hoisting works formerly used by Bever, at Willow Valley, have been taken down and are to be erected on the old Cunningham ledge, above the Wigham. A portion of the machinery is already on the ground, and will be put up immediately.

EXCELSIOR.—From the *Star* we gather the following: the following are the correct figures of the clean-up of the Mohawk rock recently crushed at Winton's mill: Forty-eight tons of rock gave a yield in free gold of \$1,633.02—which is \$34.40 per ton. To this the sum of \$600—the product of the sulphurets—must be added, making a gross result of \$2,233.02, in forty-eight tons of ore. This company, at their quarterly meeting, resolved to build a mill, and will commence its erection immediately.... We were shown some very fine specimens of white quartz, a few days since, from the Lake company's ledge, southwest of the Excelsior.... Four days' run of the U. S. Grant company's mill, which, by the way, is a small 5-stamp affair, yielded 114 ounces of amalgam from the copper plates. The mill is now running day and night.... The Eclipse company are about to have fifty tons of their ore reduced at the Winton mill.... The Mayflower company have sunk a shaft 200 feet, and are getting out very fine sulphuret ore.... The Aurora company, Wagner ledge, are about to have ten tons of their ore crushed at Nevada.... We were shown on Saturday a small button weighing about \$4.50, obtained from 240 pounds of croppings of the Alhambra company's claim.... We are informed that Messrs. Parsons & Co. contemplate erecting a mill about one and a half miles southwest of town. They think they can have it in running order by the first of November.

The *Gazette* of 22d September says: We had a conversation yesterday with O. Crandall, one of the owners of the Enterprise mine, near Meadow Lake. He informs us that they are now taking out and reducing a considerable quantity of ore, which yields an average of about thirty dollars a ton in free gold, besides the amount contained in the sulphurets, which are saved to be worked by the chlorinating process. The mill is now working satisfactorily, although they have not yet pans enough to amalgamate as much rock as they can crush. They have not yet ascertained the size of the mine, having found but one wall; but they are now working with the view of taking out ore, rather than of exploring the mine.

Placer County—

The *Herald* of 22d instant has the following: Yesterday we were shown a ball of amalgam, weigh-

ing between ten and eleven ounces, the product of free gold from ten tons of quartz from the Wells' lead, which was crushed at Wely's mill. The amalgam being worth \$17 per ounce, made this crushing average \$17.50 per ton. From this lot of quartz 800 pounds of sulphurets were concentrated, which are yet to be worked.... A friend writing us from Yankee Jim's, says several cement mills are being erected in that section. Mr. Ambruster is now building one on Georgia Hill. The claims on this hill years ago were famous for their richness. The mill on the Missouri claim, in the same vicinity, is said to be making money.

We clip these items from the *Stars and Stripes* of Sept. 26th: The Suffrage Company found richer rock at twenty feet than at the surface, and have contracted for sinking the shaft another twenty feet.... The Civil Rights Company, near Newcastle, are still progressing with their shaft, and taking out excellent rock.... Captain Mallett is pushing work with energy, and every day more fully develops its richness.... Messrs. Blankman and Wahlgreen, we are informed, have made another rich strike in the Friday lead, near Ophir, taking out rock which literally sparkles with free gold.

Same paper says: There is much activity in mining and prospecting in this section. Many new leads have been discovered, and old ones are being worked with unusual energy. The evidences daily multiply that the quartz mines in this section of Placer county are as rich as these in any other part of the State. Capitalists begin to learn this truth, and there have been some considerable investments made in our mines by parties from San Francisco and Sacramento, within a few weeks. We predict that within a year from this time the Placer county quartz mines will attract as much attention as these of any other county in the State.

Plumas County—

The *National* of the 15th, says: We learn that the Bull-Frog Company, near Rush creek, have recently struck their ledge by a new tunnel at a depth of 190 feet, and discovered excellent pay.... Mr. C. Cahalan, who has been prospecting for several years upon a ledge near the Crescent Mills, in Indian Valley, has struck a very rich vein of quartz.

The *Quincy Union* of 22d inst., says: We learn that Messrs. Peel & Co's claims near Grizzly Creek, are paying an ounce per day to the hand. They have just put up over 2,000 feet of iron pipe, to conduct the water to their claims, at the expense of over \$3,000.

Correspondent of the *Appeal* of 26th, writing from Nelson Point, says: River mining thus far has not proved very remunerative. They have worked out one set of claims, and are now shifting their water-derrick, wheels, etc., to another. White & Fell, are putting in a wing-dam two miles below the "Point," where they expect to find new ground. Richards & White are not down yet; they have in three wheels and four pumps, which is thought by some to be sufficient, but by others not. Jimmie, on Nelson Creek, has done as well, if not better than any of them. The Chinese claims are all well under way, and from the two and three ounce pieces that we get to see occasionally, judge that they are doing pretty well. Messrs. Jackson, Jelly and Mitchell have completed their preparations for another run in their hydraulic claims. Quartz mining has commenced in Mohawk Valley. Fred. King & Co., of the Sulphur Spring Ranch, have put up a small mill. They commenced with four stamps, and made a run of ten days, which, from cleaning the apron alone, paid \$500.

Shasta County—

The *Courier* of 22d inst., has the following items: At Lower Springs, Mr. George recently reworked some of the tailings run through Peart's mill last winter and found that they paid at the rate of ten dollars per ton. He has also just finished crushing three tons of rock taken from a ledge which has once been pronounced worthless, and the clean up shows a result of eighteen dollars to the ton.

.... Long's old quartz mill, which has been standing idle near Middletown for several years, has been purchased by Kelly & Co., and will be removed to the Jollie claims, near Muletown.... We understand that the Dog Creek mines are paying unusually well this season, and that it is a common thing for miners to find good sized nuggets in their sluices, some of which weigh from forty to ninety dollars.... New and rich placer diggings have recently been discovered on Hall's Gulch, which lies in Trinity county, and just over the Dog Creek divide. Quite a number of miners have gone there from Portuguese Flat and Hazel Creek, in this county.... Mr. McCall recently shipped forty-seven hundred pounds of picked rock from the Chicago ledge to San Francisco, where he disposed of it for about \$500. Since this shipment parties at the Bay are anxious to purchase the Chicago, but have not yet offered a sum sufficient to induce the present owners to sell.

Sierra County—

The following items are from the *Messenger* of the 22d inst.: The Madison quartz ledge, situated between China Flat and Jim Crow Canon, some three or four miles above town, has been sold to New York and Chicago parties, Joseph Voshay, principal, for the sum of \$5,000.... We learn that parties up the South Fork some eight miles have struck excellent

prospects in a tunnel they are running into the hill for gravel diggings.

The correspondent of the *Messenger* gives an account of a rich mine in Sierra, now lying idle, from which we condense: The Primrose mine was located in 1858. It was for a time worked successfully. Some \$240,000 was taken from it in the course of three years. In 1861, the southerly extension was purchased for \$30,000, borrowed at a ruinous rate of interest. The mill was enlarged, and injudiciously removed. Creditors became pressing, and the property was sold under the hammer. Much of the rock is rich. The writer observed several men selecting pieces and working them with a small hand mortar. They realized \$5 or \$6 per day to the man. The placer ground in the neighborhood will yield, where water can be had, about an ounce of gold to the hand.

Siskiyou County—

The *Yreka Union* of the 22d says: Fort Jones is improving rapidly. The place has both agricultural and mining advantages. The best quartz leads in the country are situated only a few miles from town, and some of them are being profitably worked, and only need machinery and capital to develop the vast wealth which they undoubtedly contain. Where gold can be seen in quartz, and good wages can be made by pounding it up in a mortar, we do not understand why they do not resort to some more extensive mode of obtaining the gold.

Yuba County—

The *Nevada Gazette* says of the Blue Gravel mines: These mines are situated at the foot of the ridge which extends nearly the whole length of Nevada county, starting near the head of Greenhorn, forming the divide between that stream and Deer Creek, and running to the right of Grass Valley and by Rough and Ready. The ridge is cut in two at Quaker Hill, and a rifle appears to have been formed by some cause at Smartville, near where the ancient stream debouched into the valley, which accounts for the immense deposit of blue gravel at that place. The Alta shaft, near the Rough and Ready road, from which an immense quantity of gold has been taken, and we believe is still being worked, is situated on this ancient channel; and there is every reason to believe that the channel for a distance of forty or fifty miles is rich in gold, and will eventually be worked.

The *Appeal* says: The two boilers, smoke-stack and breeching, lately arrived from below for the Pennsylvania Mining Company, were shipped yesterday (all but one boiler weighing 3,500 pounds) to Brown's Valley.

The owners of the Blue Lead Gravel Claim, at Smith's Flat, cleaned up last week \$1,700, after a run of about three weeks, working eight hands.

NEVADA.

Washoe—

The yield of ore from the Yellow Jacket mine, for the month of August, was nearly a thousand tons, which yielded, under the stamps, the sum of \$379,699.92, averaging about \$38 to the ton. This mine is now in fine condition.... The Crown Point mine, at Gold Hill, yields at the rate of a hundred tons of ore per day.

Reese River—

From the *Reveille* we clip the following items: The Cortez, Giant ledge, belongs to the Mount Tenabo Company, which is the present style of the original Cortez Co. Two days ago, a lot of crude bullion was brought in from this lode. We saw this morning at the assay office four bars of silver, obtained from this bullion, which were of the following weight, fineness, and value: No. 1, 943 ounces, 910 fine, \$1,025.53; No. 2, 916 ounces, 916 fine, \$1,084.61; No. 3, 903 ounces, 893 fine, \$1,043.46; No. 5, 492 ounces, 824 fine, \$524.87. We learn that the ore was worked up to thirteen per cent. of the pulp assay.... The new mill of the New England and Nevada companies, located at Kingston, will commence operations with ten stamps next week. The mill is supplied with four furnaces. The first work will be done for the Silver Mining Company, which will furnish ore from its Mother Ledge, in the Santa Fe District, about five miles from the mill.... The Diana mine is again yielding bullion, after a long interval of quiet. A bar of bullion, valued at \$1,010, was obtained from five tons of ore reduced at the Keystone mill.... A pack-train left Austin on the 18th, to bring in a load of the rich ore from Danville district, which is to be thoroughly tested by mill process.... It is probable that a mill will be put up this fall in Hot Creek district. The value of the mining prospects in that district has been increased by the discovery of a large tract of fine timber.... In the Danville district eight or ten men were prospecting with fine success.... The fame of the riches of the Reveille district was attracting the attention of prospectors.... We were shown to-day (19th) a large pill box full of specimens of horn and native silver from the Twin Ophirs of the La Plata Company, in the North Twin River district.... On the 19th a bar of bullion, weighing 3,000 ounces, was reported from the Diana.... The Old Dominion,

Hot Creek, lies some four miles south of the Indian Jim ledge, and has been traced for several miles. Its width ranges from twelve to twenty feet. Its mineral exhibited to us is of a very high grade, and may be treated quite successfully without roasting. A toll road to Hot Creek is already commenced. It will not be more than one hundred miles long.

A letter to same, in its issue of September 21st, says: I have never seen a mining district where labor yields so remunerative results as it does in Hot Creek. Wherever a mineral-bearing vein has been worked upon, it has invariably turned out well. How far down the rich ore found on the surface will continue, it is impossible to say, but already there is mineral enough in sight near the surface to keep a dozen mills at work for several years.

Same says, 22d inst.: Three assays of Old Dominion ore, yielded as follows: No. 1, \$917.37; No. 2, \$70.68; No. 3, \$23.56. Two others yielded \$1,557.71, and \$236.97.

Emeralds.

The Union of September 22d has the following: It is gratifying to note the constantly recurring evidence of rapid progress in the development of our mines. The Philadelphia company is driving away at its work with energy and perseverance. John D. Waters is developing the Juniata mine with the most flattering prospect, a large body of ore which will pay handsomely for crushing being already in sight. The Golden Age and Empire company will start up again in a short time, and will keep them till the mine has been thoroughly tested to the depth of five or six hundred feet. The Oxford Beta and Union tunnels are being pushed ahead day and night. Other mines and shafts are being worked with energy and perseverance, and the result everywhere is satisfactory.

Samuel B. Martiu designs sending forward, at an early day, to the Silver Peak and Red Mountain mines, two large double engines, of 100-horse power each—two large boilers, weighing 10,000 pounds each, to each engine; both engines have two 14-inch cylinders.

Humboldt.

We gather these items from the Register of September 22d: Arrangements are being made for working the National and Downey ledges. Work in the Chameleroo making fine headway. The ledge is looked for every moment. Ore is now taken from the Yo-Semite, estimated to be worth \$100 per ton. Specimens from the Sulphur mine, near Humboldt City, have induced certain parties in San Francisco to propose the working of it. In a Winnemucca district, Pease is running a tunnel in the ledges of the Union Series, for an Eastern company. Holt's mine is running most of the time on quartz from the Monroe Series.

The Montezuma mine is looking well. The ore had long ago been thoroughly tested, and found profitable, whether worked by mill process or smelted. As far as yet developed, the ledge shows what those best informed estimate at 15,000 tons of ore worth \$90 to the ton. New and more extensive furcaces are to be built at once. The fire brick are on the way. One hundred thousand bushels of charcoal have been contracted for.

IDAHO.

The Idaho City World of the 8th inst. has the following: The long contemplated project of a bad rock flume in Moore's creek seems about to be realized. Several energetic business men are going into the work. A survey has already been completed. The East Hill Tunnel Company have commenced operation, and are very sanguine of success. The tunnel starts from Bear Run, and is being run in a southeasterly direction to strike beneath the dividing ridge. It is now in about forty feet. If the tunnel succeeds, it will cause a revolution in mining in this Basin. Old times will come back again. Placerville is looking up. Tunnels are being driven into the hills in all directions.

We were shown yesterday, says the Statesman, by Mr. Packard, a nugget worth two hundred and thirty dollars, said to be the largest ever found in the Territory.

MONTANA.

We clip the following items from the Post of September 8th: In the Alameda ledge, a tunnel about one hundred and fifty feet in length has been excavated in the side of the hill, which is chiefly composed of rock. A shaft has been sunk to the depth of twenty-five feet. New diggings have been struck on a branch of Fish creek, in the Silver Star district. Prospects have been obtained which go to show that the gulch is the richest discovered since the discovery of Alder. On Decatur, No. 6, the shaft has been sunk to the depth of three hundred feet, and is now one hundred and fifty feet through, and below what is thought to be the cap rock. The crevice at the bottom of the shaft is from five to ten feet in width. The Butterfield and Hopkins mill, which is located on this lead has been operating very successfully for some two or three weeks past, and there are still forty cords of rock ready for crushing.

Letter from Bannack says: The Linthi stampede is at an end. It turns out that the new diggings will not pay much over wages, yet some are preparing to mine and winter there, but most have returned to Bannack. Our streets are not deserted, but every day adds to the progress that is being made in our mining and business affairs. A train of ten wagons arrived this evening with Prof. Eaton's outfit for mining purposes, for the New York and Montana Mining and Discovery Company, consisting of three complete sets of furnaces, one iron foundry, and tools and lathe for a machine shop.

Letter from Helena says: The miners in this vicinity are doing well, and in a number of small outside gulches, the stuff is found in paying quantities. Mitchell's gulch, near Montana City, is prospecting from twelve cents to two dollars and a half to the pan, and sluicing will be commenced there in a few days. The bars on the Missouri river are also reported rich. The big Ten Mile ditch, about sixteen miles long, will be in a condition to supply this town and environs with water in a few days.

Letter from Highland district, Deer Lodge county, says: The gulch is turning out very well as far as prospected. On the discovery claim, one week ago, the discoverers took out a nugget weighing thirty-four dollars and twenty cents, and have, on an average, one dollar to the pan since that time. On number nineteen, they have, on an average, three dollars to the pan; and on number seventeen, they beat the discoverers by taking out one nugget weighing thirty-six dollars, lacking twenty cents, and another weighing twelve dollars. On every claim where they have struck gravel, they have obtained prospects of from three to twenty-five cents to the pan, and not down over eight feet.

The Republican states that large deposits of coal have been discovered on the Dearborn, about forty miles from Helena. It lies in the form of a ledge, which is three or four feet in width.

The Idaho World says: Intelligence from the Blackfoot country is anything but encouraging. Letters from several former citizens of this place have been lately received, and they concur in representing a gloomy state of affairs. Large crowds are going down the Missouri, and many are going to Salt Lake. The Elk Creek country will almost be depopulated during the winter.

COLORADO.

From the Journal of September 4th we clip the following items: Ed. Moores has leased the Empire mill, mouth of Chase Gulch, and will have it in running order shortly. Thus, one by one of the old stamp mills are being put to use, and not allowed, as has been the case of late years, to remain idle—"dead stock" on the hands of those owning them. Mr. Kipp, on the Leavitt iron lode, has struck a vein of good looking ore at the depth of eighty feet, which is from ten to fifteen inches in width. Georgetown is said to be the liveliest place in the territory. There are still about forty men in the so-called Bear River mines. Some sluices are running, getting about a dw. a day per hand, but most of those there are hunting for the source of the gold, high up among the beads of the stream. Several Eastern parties are getting at work in the Suako River mines. The great richness and extent of the mines is better proved by every blow struck.

The editor had made a visit to the mines in Clear Creek county. We condense his report: Mr. T. H. Lowe is developing the Robinson lode, head of Virginia Cañon, for the Kentucky and Colorado Company. He is getting out some first-class ore. He is also sinking on the Rufus Snyder in Morrie district, for the Louisville and Mill City Company. Further, he is taking ore from a very fair crevice on the Seaton, No. 8 west, for the Lowe Mining Association of Boston. The 12-stamp mill belonging to the latter company was to start soon.

The property of Wamack and Seaton, reputed one of the most valuable in the country, is not being worked. * * About two and a half miles below Idaho, eighteen from Mount Vero, and thirty-three from Denver, General Buford is getting the Federal Union Mining Company under way. The mines consist of the General Buford, Moline, Deerfield, Virgin, Mammoth and Empire lodes. A tunnel has been run to the Buford—forty-three feet—striking it fifty feet from the surface. There is a shaft on the Moline thirty-six feet deep, also an incline, being run in for the purpose of exploration. The other mines, except the Deerfield, are not being worked at present. The dam and mill are now in course of construction. Stone arastras are to be used at first. On the Crystal lode the Fulton Mining Company have their mine well opened with from 300 to 500 tons of ore out, and have taken some steps toward building a mill. They have a shaft 100 feet deep. The Star company have a mill building raised and enclosed.

George Lovelock has found a marsh of thirty square miles in extent, in which peat abounds. It is from four to six feet in depth. The Reporter says: "The value to our mines of this discovery, if the article be genuine peat, and of such extent, is almost incalculable."

CHEAP PROCESS FOR WORKING QUICK-SILVER ORES.

J. L. Kleinschmidt communicates to the Journal of the Franklin Institute a cheap process for working ores containing copper, silver, antimony and quicksilver, which has been practiced for sixteen years at Stefanshutte, in Hungary. This process was represented at the London Universal Exhibition of 1862, when it received a prize medal for its novelty and economy. Our present purpose is merely to describe the manner in which the quicksilver is obtained as the first product of the ores, and which we have thought might be made applicable to working some of the poor cinnabar ores of this State. The process is described substantially as follows:

The great volatility of the mercury requires that it should be separated first. The process is a very simple one, but nowhere else in use, and consists in the roasting of the ores in large round furnaces, and collecting the quicksilver in the upper layer of the ore. On the bottom of the furnace, if it may be called such, is placed a layer of fine ore of four inches in thickness, then follows a layer of wood of twenty-two inches, and on this six inches of charcoal. Now follow layers of partly roasted ore, but not yet free of quicksilver. The fine ore is added in stripes radiating from the center, whilst between these the lumps are placed, otherwise the furnace would have no draft. Therefore the ores, which have been once roasted, but yet contain mercury, are separated by sieves into fine ore and lumps. Uppermost come the fresh unroasted ores, and the top layer, in which the quicksilver is condensed, consists altogether of lumps. The whole quantity of the ore thus arranged should amount to about fifty tons. A wood-pile is in the center of the kiln, from which it is fired and burns during about four weeks. In consequence of the heat produced by the burning of the ores, the mercury is volatilized, and passes through the upper layer of the ore, where it is condensed in the form of globules. It is only necessary that these remain throughout and at all times cold, and that the places which perhaps get warm are at once covered with cold lumps to prevent the loss of mercury; therefore watchmen are at the furnaces day and night during the whole process of the operation.

After the kiln is burnt out, the upper layer, which is full of metallic quicksilver, is carefully taken away and washed in wooden tanks by the help of sieves, as it is done in the washing of the ores. The quicksilver goes through the sieve, and remains with the ore dust on the bottom of the tank. From the latter it is separated by boys, who wash it in small wooden troughs. [Californians, who are accustomed to the use of the "long tom," would at once improvise a much better method than the above, for separating the quicksilver from the surface of the coarse lumps of ore.] For this purpose a building are three tubs containing water, and on each of them stand three or four boys from ten to sixteen years old. Every one takes some of the mixture of dust and quicksilver in his trough (sic) and, keeping it below water edge, he gives it a great many small shocks against the wall of the tub, whereby the quicksilver settles to the bottom of the trough. That part of the roasted ore which yet contains quicksilver is worked over a second time, as described above; the lower portion, however, which is free of mercury, goes to the furnace.

In working for quicksilver alone, this portion of the ore would, of course, go to waste. Rude as this process may seem, it is stated to the authority before us, that in working ores containing from less than one to as high as sixteen per cent.—the average being 1.63—the yield of quicksilver reaches ninety-four per cent. of the assay. In former times a great many costly experiments were made to obtain the quicksilver by the use of retorts, furcaces, and every other known expedient, with condensing chambers constructed after the usual form. After all these costly experiments had been tried and abandoned, resort was finally had to the simple process described above, by which the cold ore itself is employed for the condensation of the quicksilver. This process is now a decided success, and has superseded all others at that locality. Of course, the roasting should be done on a properly constructed and tight hearth of fire-brick.

It may be proper to state, in relation to the chemistry of the process, that there is a large amount of protoxide of iron present in these ores, which must greatly assist in oxidizing the sulphur and driving off the quicksilver. Gray copper ore will give out its mercury on being heated in a close retort; but red cinnabar contains so much sulphur that it must have access to oxygen before it will part from its metal. Nothing is said in the account of this process about the use of lime, which could certainly be made useful if it could be obtained without much cost. The sulphur has free opportunity to escape from the best sulphurous acid gas; so that we have then three causes by which the quicksilver may be set free—1st, heat alone; 2d, the oxygen of the atmosphere; 3d, the influence of the oxyd of iron. A covering of turf, kept wet and cool, would, doubtless, be a great improvement, and would collect a large amount of free sulphur, which might, perhaps, be made of some value, as it could easily be collected with the quicksilver. Turf is sometimes used in some parts of England, in the manner described, for the especial purpose of collecting sulphur from pyritous ores.

Judicious Resolutions.

Several of our most substantial and judiciously managed mining corporations have passed resolutions, since the approval of the new assessment law, requiring all notice of assessments and sales to be published in the MINING AND SCIENTIFIC PRESS, the only thorough (daily or weekly) mining journal on this coast. Our efforts to concentrate all mining advertisements in one paper, for the economical convenience of shareholders and assessment payers, are meeting with decided success. Those who believe in supporting the mining cause, should bear our paper in mind, and bring up this subject at the next trustee or shareholders' meeting.

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. Thomas Starr is Agent for the MINING AND SCIENTIFIC PRESS in Nevada, and will canvass the principal cities, towns and districts of that State. August 25, 1866.

Mr. O. P. Truesdell will act as our Corresponding Agent and Solicitor in the interior of this State, from this date August 25, 1866.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.

Mr. J. N. Hudson, is authorized to solicit subscriptions, advertising, etc., for the MINING AND SCIENTIFIC PRESS, in San Francisco, and to receipt for the same.

The Agency of Chas. A. Russell and Erwin Zimmerman, for this paper, ceases from this date. Sept. 8th, 1866.

SUBSCRIBERS who do not receive the MINING AND SCIENTIFIC PRESS in due time, are requested to inform the publishers.

San Francisco:

Saturday Morning, Sept. 29, 1866.

CONTRIBUTED FOR OUR CABINET.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, corallines, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

A. H. Howk, Weston, Nye county, Nevada. We have received a fine collection of ores from Mr. Howk, among which we recognize chloride of silver, black sulphurets, blue and green carbonate of copper, No. 5; a specimen of jasper, No. 4. The collection also contains a very fine specimen of fluoate of lime (not numbered), showing an aggregation of very perfectly formed cubical crystals. Fluor spar is slightly soluble in waters containing bicarbonate of lime in solution. The alkaline carbonates decompose it, producing carbonate of lime or calcite, and a subsequent change of the calcite may produce other forms of crystals or pseudomorphs. Fluor spar is often changed to quartz by substitution, in the same manner as wood becomes petrified. We also notice in this collection several very interesting twin crystals, quite extraordinary in character, which are evidently feldspar, in a state of incipient decomposition. We shall probably allude to these further at some future time. The specimen marked No. 1, is evidently a tungstate—probably of iron and manganese. The collection also contains a very fine specimen of petrified wood—probably an extinct variety of pine.

Mr. GEORGE W. BUNNELL, of 611 Clay street, San Francisco, sends us a very fine specimen of petrified oak, a portion of which is beautifully opalized; the balance being highly silicified, but retaining its fibrous character, and being very soft. It was taken from a shaft sixty-five feet in depth, at French Gulch, in this State.

CALIFORNIA LOCK AHEAD.—A special premium was awarded Mr. W. C. Bussey, for his superior combination powder and hrglar-proof safe lock, at the recent State Fair. We are sure no award was ever more meritoriously bestowed. This lock was described at length in the PRESS several months since. At that time it was adopted by several haaking houses in this city, and we are now assured that the remarkable claims asserted in favor of the lock at that time, have been confirmed since by its practical use. We feel an interest in this California invention, and wish to see it speedily meet with the success it is ultimately certain to attain. Mr. Bussey, having properly first fairly tested his lock in California, is now desirous of introducing it in the East, and offers to dispose of the right for several States at very reasonable rates.

MERCANTILE GAZETTE AND PRICES CURRENT. This long established and highly useful journal has removed its office of publication to the northeast corner of Clay and Battery streets. The publishers, Messrs. E. D. Waters, Sr. & Co., have secured a commodious suite of rooms, conveniently located and admirably adapted to the increasing business of the paper.

QUARTZ MILLS ABOUT VIRGINIA AND GOLD HILL DISTRICTS, NEVADA.

Showing the Amount of Ore Reduced per Month, Number of Stamps Employed, Number and Variety of Grinding and Amalgamating Pans, and other Machinery.

We believe the following schedule gives the most comprehensive view of quartz milling about Virginia City, Gold Hill and neighboring places, yet published. As an article for comparison and reference, it will be highly appreciated by millmen and parties interested in mining machinery and quartz operating everywhere. It has cost no little time to obtain this information and present it in so brief a form. The statement shows the amount of ore reduced per month, which, in many instances, varies from the full capacity of the mills:

NAME OF MILL.	TNS. MTH.	NO. MILLS.	Mills Located in Virginia City.
Summit.....	900	20-11	Wheeler pans, 4 settlers, 1 small Varney pan and settler, 1 agitator.
Central.....	670	13-4	Hepburn pans and 4 settlers, working 500 tons wet; 4 furnaces and 6 barrels, working 170 tons dry.
Ogden.....	1,000	22-12	Wheeler pans, and 4 settlers.
Empire.....	800	21-24	Knox and 2 Wheeler pans.
Hoosier State.....	400	8-24	Knox Pans.

Mills Located on T-Mile Canon.

Mariposa.....	600	12-6	Wheeler pans, prospecting battery, 2 Knox pans, 3 large settlers.
Chas. Land's.....	1,000	20-1	Blake's breaker, 10 Wheeler pans, 5 settlers, and 2 grinders for grinding amalgam and working slum.
Bassett's.....	700	16-4	Improved Wheeler and 2 Hepburn pans, 2 tubs and 3 settlers.
Winfield, or } Booth's, } Gould & Curry.....	1,000 3,502	18-1	Blake's breaker, 8 Hepburn pans, 1 grinder and 4 settlers.
Empire State.....	700	15-2	Hepburn, 2 Wheeler, and 20 4 ft. Knox pans.
G. Attwood's } Ply Deland's }	600	16-26	Knox pans, 2 Wheeler pans, and 2 settlers.

Mills in Gold Hill and Gold Canon.

Eclipse.....	700	15-8	Hepburn pans, 2 graders and 4 settlers.
Crowa Point.....	250	8-13	Knox pans and tubs.
Rhode Island } Gr. P. Co. }	1,350	25-8	Hepburn and 10 7-foot Knox pans.
Cuba.....	400	14-14	tubs and 1 agitator.
Gold Hill.....	473	14-24	Knox pans, 6 ft. tubs, and 4 settlers.
Sapphire.....	800	16-56	Knox pans.
Petaluma.....	300	8-18	Knox pans.
Imperial.....	1,100	41-74	Knox pans.
Empire.....	900	16-12	Wheeler pans, 6 settlers and 2 agitators.
Marysville.....	500	9-30	5 ft. plain pans and 2 agitators.
Douglas.....	450	10-26	plain pans and 1 agitator.
Atlas.....	750	15-8	Hepburn pans and 4 settlers.
Piate, Piate Co. }	1,200	20-12	Hepburn pans, 6 8-ft settlers and 1 grinder.
Pacific, Al. }	1,300	30-15	Wheeler pans, 2 large settlers and 2 graders.
Succor.....	600	20-12	Hepburn pans, 24 Walelee flat-bottom pans, 1 settler and 1 agitator.
Confidence.....	650	12-8	Varney pans, 5 settlers and 3 agitators.
C. C. Reduction.....	600	15-6	Hepburn and 4 5-ft flat bottom pans.
Phoenix No. 1.....	500	16-6	pans and 4 settlers.
Eastern Slope.....	550	12-12	Hepburn pans and 3 large settlers.
Swaasea.....	600	12-22	6 ft. tubs, 3 settlers, prospecting battery and pan.
Excelsior.....	530	10-18	Knox pans and 1 settler.
Sheramonto.....	550	12-12	7 ft. iron pans and 1 agitator.
Weston's.....	700	15-9	Wheeler pans, 5 settlers and 1 agitator.

Mills on Carson River, from Empire to Dayton.

Mexican.....	1,250	41-12	Hepburn pans, 4 furnaces and 10 barrels. By wet process, 1,000 tons; by dry process, 250 tons.
Yellow Jacket.....	2,300	40-30	Hepburn pans, 15 settlers, 2 agitators and 2 graders.
Bruaswick.....	600	8-8	Varney pans and 4 agitators.
Merimac.....	1,350	20-15	Wheeler's, 4 Knox and 1 Varney pan, prospecting battery and pan, 2 large settlers and 10 agitators.
Vivian.....	750	16-8	Wheeler pans, 4 settlers and 1 agitator.
Santiago.....	1,100	24-1	Blake's breaker, 14 Wheeler and 4 Hepburn pans, and 9 settlers.
Eureka.....	1,100	20-10	Wheeler pans, 5 settlers and 2 agitators.
San Francisco.....	500	10-3	Hepburn pans and 7 tubs.
Franklin.....	500	10-2	Wheeler and 2 Hepburn pans, 5 tubs and 2 settlers.
Island.....	500	10-10	Varney pans and 3 settlers.
Ophir Co.'s.....	1,200	24-12	Hepburn pans and 6 settlers.
Dayton, No. 1.....	500	20-6	Wheeler pans, 2 8-ft settlers and 2 agitators.
Dayton, No. 2.....	800	15-8	Varney pans, 4 settlers and 3 agitators.
Birdsall & Carpenter.....	2,400	30-20	Wheeler pans, 10 large size Wheelers, 5 agitators, 1 grinder and 1 Blake's Rock breaker.
Golden Eagle.....	500	10-24	Knox pans and 1 settler.
Illinois.....	500	20-6	Hepburn pans, 2 settlers and 3 agitators.
Imperial Co.'s.....	2,400	56-16	Blake's breaker, large size, 14 Hepburn pans, 27 7-ft tubs, and 7 7-ft settlers.

Mills at American Flat.

Bay State.....	1,400	23-14	Wheeler pans and 7 settlers.
Rigby & Co.'s.....	400	15-5	Varney pans and 4 settlers, 1 extra pan and settler for tailings, and 1 barrel.

Mills in Washoe Valley and Vicinity.

Temecac.....	800	15-12	Wheeler pans and 3 large settlers.
Manhattan, } N. Y. Co. }	1,300	24-16	pans, 8 settlers and 1 grinder.
New York.....	1,300	24-16	Varney pans, 8 settlers and 1 grinder.
Atchison, } Savage, Co. }	1,200	20-16	breaker, 16 Wheeler pans and 8 settlers.
Minnesota, } Savage, Co. }	1,000	16-1	breaker, 12 Wheeler pans, 6 settlers and 1 agitator.
Buckeye.....	700	10-1	breaker, 8 Wheeler pans and 4 settlers.
Ophir Co.'s.....	450	72-2	Working only 36 stamps, Freiberg process—9 furnaces, 24 amalgamating barrels, work 43 men. Full capacity of mill 750 tons.
J. H. Hall's.....	1,725	60-2	Blake's breakers, 8 furnaces, 20 barrels, 6 Varney's and 4 Wheeler & Randall pans.

Total—62 mills; 53,787 tons; 1,226 stamps; 219 pans.

The above is a correct list of the mills now running on ore from Virginia and Gold Hill Districts.

The information has been furnished to our own reporter (Mr. Thomas Starr), in every case by those well qualified to give it correctly. There are a few small mills and arrastras running irregularly, and not enumerated in this list, and working about enough ore to compensate for stoppages of the other mills.

There are about a dozen mills now idle in the District, some of them undergoing repairs, but none of them in running order.

Hepburn & Peterson.

This mill, at Frank Town, above Ophir, on Mill Creek, deserves more than a passing notice. It is run by steam and water. The water is applied on a breast wheel of sixty feet diameter, and twelve feet breast, giving at full capacity about 300-horse power. Forty stamps are used for the Freiberg process, and twenty for wet, making sixty; two of Blake's breakers, improved jaw; eight furnaces, and twenty barrels for dry process, and six Varney and four Wheeler & Randall pans for wet. Four more Varney pans are to be introduced. Mr. J. B. Hiskey, Foreman and Assayer of the mill, is experimenting with and working some of the Black Rock ore, and obtaining good results. Working capacity of mill—dry process, 675 tons; wet process, 1,050 tons.

GOLD MINING IN AUSTRALIA AND CALIFORNIA COMPARED.

No little excitement was created in this city, a few weeks since, by the publication in the daily papers of some extracts from a report upon the mines of Australia, by Mr. Hopkins, a distinguished English mining engineer, the results set forth in which were considered quite extraordinary; and from which it was inferred "that quartz mining in Australia had reached a point of system and perfection not yet attained in California." Also that "The moral to be gathered from Mr. Hopkins's report is, that with all our boasted ingenuity skill and energy, we have allowed John Bull, in Australia, to get ahead of us in quartz mining." Again, in the same paper we read, speaking of the Australian method of working poor mines, "it only remains for us to develop and work them with the same care, to make our own dead and deserted mining districts the most prosperous in the world."

We took no notice at the time of the ridiculous comments upon this report and inferences drawn therefrom, depreciatory of the miners and mechanics of California, for the reason that we supposed that no persons who took any pains to inform themselves would be misled in so plain a matter, even by our "respectable dailies." Having learned, however, that some of our capitalists had begun to think, sincerely, that Californians really knew but little about mining, and were even talking of withdrawing, or at least withholding, their capital from mining investments, until such time as they could import a few Australians to teach as how to work our own mines, we have thought it time to disabuse the public mind of such erroneous and mischievous ideas.

It is not at all a matter of wonder that such opinions should prevail, and that our miners should call in vain for capital to aid them in developing their mines, when such paragraphs as we have quoted are seriously put forth in those publications to which capitalists are accustomed to look for reliable information. And yet we have before us even another paragraph, more discouraging and more ridiculous than either of the above. It reads as follows, and may be found in the *Bulletin* of the 28th June:

"The enormous extent of poor ores, not workable by any process now in use on the Pacific, but which, if this Australian method is applicable, might be profitably mined, should be a sufficient inducement to send a skilled engineer to examine and report upon the Australian quartz mines. But even the consideration of increased economy in working mines already paying well would justify the leading companies sending an officer at their joint expense to ascertain the truth of these statements, and answer the question whether California can learn anything from the example of the younger gold fields of Australia."

We trust our moneyed friends will not act too hastily in reference to the above suggestion, for it is more than probable that were they to send forward some "skilled engineer" for the purpose specified, he would meet on the way some Australian engineer seeking the shores of California for the very same class of information! For, in late mining journals published in the quartz mining regions of Australia, we find the frank admission that California is ahead of Australia, both in her machinery and processes. Nearly a year ago, we received private letters from Australia, making the same acknowledgment, and asking for information and machinery to enable them to work their ores more perfectly. By reference to our issue of August 25th, it will be seen that California machinery is already being introduced there. If San Francisco capitalists will take and read the paper published at their very doors, and devoted to the specialty of mining, they will not be carried away with such erroneous ideas.

The great bug-bear held up is the report of Mr. Engineer Hopkins, that the Black Hill Mining Company is making quartz pay a fair profit that yields only two dollars a ton. It should be borne in mind that the quartz which that company is crushing is a large mass of decomposed "out crop," which is put through a mill at the rate of about four tons a day to a stamp. Thousands of tons of such rock, taken from the old "dump piles" about Grass Valley have been crushed, at the same rate and at no greater cost than is required for the "Black Hill" ore.

Mr. Attwood, another skillful Engineer, and old Grass Valley miner, with his associates, is now putting up a 40-stamp mill on a mine near Lincoln, almost identical in character with the Black Hill mine in Australia, which he will guarantee will crush as much as the 60-stamp mill of the Australian company. In fact, a five stamp mill, already on the mine, has for a long time been crushing at the rate of over thirty tons per day—a much greater duty, per stamp, than is being obtained from the wonderful Australian machinery, about which so much has been said.

The Australian company pays ninety-eight cents per ton for taking out and delivering their rock at the mill; Mr. Attwood has let a contract for taking out and delivering his ore at the mill for forty cents per ton, 250 tons to be delivered daily, and he will crush it, or can let a contract for having it done, at an expense of forty cents more, against sixty-one cents, the reported cost of the Australian company!

It will thus be seen that the California company can make a handsome profit out of their mine at a yield per ton which would run the famous Australian Black Hill mill in debt at the rate of over \$1,000 per week! We presume that it is the calculation of Mr. Attwood to work this mine chiefly with Chinese labor, which can be obtained here as cheap as white labor can be had in Australia.

With regard to the other mines to which Mr. Hopkins refers in his report, and where the ore has to be broken out from hard rock and raised up inclines, and, of course, crushed at a greater expense of power, the Australians will have some advantage in raising their rock, as such work cannot be done by any but skilled labor; but in milling, we doubt whether it can be shown that even such rock can be crushed any cheaper, if as cheap, in Australia, as at the better constructed mills of California, where the cost of crushing is given in the following extract, which we have selected from a tabulated form, in a report recently made by Mr. A. Remond, of the California Geological Survey: Mr. Remond, in his report, says the Adelaide Company, located three miles from Coulterville, crushes and amalgamates at a cost of only seventy-five cents per ton. (We are told, by those who are acquainted with this mine, that the rock there is but slightly decomposed, and not near as soft as, from the descriptions given, we must infer the rock of the Black Hill mine to be.)

We give the cost of crushing in the following mills, all in the single county of Tuolumne, a county where the general facilities for labor, etc., are below the average of the central counties in the State:

	Per Ton.
Excelsior Mill, near Uniontown (water).....	\$1.00
Adelaide Co., near Coulterville.....	.75
Daguer, North Fork Tuolumne, (steam).....	1.75
Alabama, Whiskey Hill (water).....	1.00
Preston's, Whiskey Hill (water).....	1.50
Italian, Whiskey Hill (water).....	1.50
Old Whiskey Hill (water).....	1.50
Wyman's, Whiskey Hill (water).....	1.00
Shawmut, Blue Gulch (steam).....	1.50
Josephine, Blue Gulch (water).....	1.50
Brown's Flat, Brown's Flat (water).....	1.50

Doubtless when the report of Mr. Remond

is completed for the entire State, the list of mines, where rock is crushed equally cheap, may be increased many scores in number. As to the skill in saving gold, we do not believe that either Mr. Hopkins, or any other person acquainted with the unskillful mode of working in Australia, as compared with that practiced in California, will set up any denial to the well established fact, that quartz crushing mill-work, whether for construction or operating, California mechanics and California miners are ahead of the world—the "respectable dailies" of San Francisco, and their echoes, to the contrary notwithstanding.

NOTICES TO CORRESPONDENTS.

Owing to the great and rapidly increasing amount of our correspondence, consisting largely of queries relating to various interesting points connected with Mining and Metallurgy, we find it is imperiously necessary, for want of space, to confine our replies in future chiefly to a series of brief notices, which hereafter will appear regularly under the above caption.

MOSELUMNE HILL.—Opals, according to species, have a value, varying from little more, and in some cases inferior, to that of the choicest species of agate, emerald, and jasper. This remark applies only to the common opal; a variety known by the name of *hydropne*, possesses a pearly white appearance, and is non-transparent until immersed in water—hence the name. For cabinet specimens this has some value. The valuable varieties are *fire opal*, or *girasol*, affording hyacinth-red and yellow reflections. This is more valuable than the preceding, and is only inferior in price to the precious or chatoyant opal, with its brilliant play and variety of colors. So highly is this valued, that a fine one of good size is almost equal in value to a large emerald. Opals of superior fire, set with diamonds are very beautiful. The opal is a form of silica, mixed with from five to ten per cent. of water, probably a mechanical mixture of anhydrous and hydrated silica. Some varieties contain crystallized silica, which latter can be obtained separately by dissolving the amorphous silica by means of a strong solution of potash. The matrix of opals is only found in districts that have been subjected to igneous agencies. It is probable that California will produce these gems pretty abundantly. The most probable localities being the basaltic Table Mountains, near the sources of the Tuolumne and San Joaquin, and the basalt of Shasta. Those found near your city are possibly derived from the former districts.

J. M., COLUSA COUNTY.—It is to be regretted that the speculative fever in search of petroleum, which existed about fifteen months ago, should have collapsed so rapidly, as there does actually exist in California a solid basis of enterprise in this direction, which is elsewhere alluded to in the present issue. We understand that the extraction of petroleum is favorably progressing at San Buenaventura, Santa Barbara county, and also in Tulare county. The very deep borings now in progress in Humboldt county, are not spoken of very encouragingly.

J. Y., HUNTER'S VALLEY.—The mineral you describe, judging from the situation in which it is found, is most probably a form of carbonate of copper, known by the name of "azurite," in consequence of its rich blue color. This variety of carbonate of copper is more rare than the green colored or malachite. The formation of both is attributable to the same cause, viz: the combination of carbonic acid, conveyed by the joint means of the atmosphere and the percolation of rain water, the contact of which, with oxyd of copper already formed in the vein, gradually converts the oxyd into the beautiful carbonate. Very fine and massive pieces of either variety possess a value much beyond that of ordinary copper ores of equal percentage; as many articles of *bijouterie* and richly ornamental jewels, caskets, etc., are chiefly composed of this material. In Russia, numerous individuals obtain remunerative employment in making up such articles, by whom a skill is acquired and often displayed scarcely inferior to that of the most celebrated Roman and Tuscan mosaic workers. Four doors of this character in the palace of the Emperor of Russia, have been

valued at \$50,000—the material of which they were chiefly formed was derived from the copper mines of Nischino Tagilsk, the property of Prince Demidoff. These mines are said to have afforded one hundred tons of malachite in almost a single mmes.

H. S., SUTTER.—Judging from our own impressions of the general geography of the district adjoining the Great or Mother Gold Vein of California, we are disposed to think that, although the large vein which is found in the vicinity of Jackson, and which can be traced through Sutter and Drytown into El Dorado county, is a branch of, rather than a continuation, of the true "Mother" vein, there can, however, scarcely exist a doubt but that both had a contemporaneous origin, and were formed by similar cosmical influences. If this opinion is correct, there is no reasonable ground for inferring the probability of rich ores being struck on what may be termed the main vein, as compared with one of great size branching therefrom.

NEW PATENTS AND INVENTIONS.

Under this heading we shall mention, from week to week, as occasion may demand, new and important inventions; also, the list of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most of the patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

MACHINE FOR TILLING THE SOIL.—Sylvester Woodbridge, Benicia, Cal., claims a tilling frame, tiller shaft, and guide plate, in combination with a crank on the tiller shaft accompanied with connecting rods, etc.; also a truck frame and driving wheel or cylinder, spur gear and pinion, with or without intermediate gearing, in combination with the usual means for operating this class of agricultural machinery.

DOUBLE REVOLVING PLOW.—John Mott, Danville, Cal. This machine has already been fully described in this paper. The patent for the invention was awarded during the week ending August 14th.

APPARATUS FOR DESULPHURIZING QUARTZ.—Thomas D. Worrall, Central City, Colorado Territory. This inventor claims an improvement on the mode of desulphurizing ores by forcing them through a flue by means of a wind blast, in the presence of flame. He claims 1st, Operating a blow-pipe in a confined space or flue, through which sulphurets are passing, for the purpose of intensifying the heat; 2d, Operating several blow-pipes, up flues that form a junction, so that when the flames meet they may be condensed upon each other, and thus become intensified, for the more ready desulphurizing of the ores; 3d, He claims an X-shaped flue, so constructed that the fire, starting from the extreme points, must meet in the center; 4th, A furnace, with open sides, communicating with the flues, in connection with the blow-pipe is claimed; 5th, He claims, a V-shaped receiver, with perforated base for heating the quartz, when passing over the inner surface, while the fire is passing over the outer surface, and of delivering the same into flues or upon heated plates, etc.; 6th, He claims the use of revolving fan distributors in the V-shaped receiver, in flues or in an open stack, employed for the purpose of suspending the pulverized quartz in its downward descent, and distributing the same upon heated surfaces or through flame; 7th, He claims in combination with the V-shaped receiver, spiral furnace, etc., a continuous muffle furnace, of any construction, horizontal or perpendicular, through which sulphureted ores may be passed for the purpose of driving off the sulphur, arsenic, etc.; passing over the eighth and ninth, he claims, 10th, The spiral furnace, with either a double or single flue, for the purpose of securing a gradual descent of pulverized quartz, or pyrites, while the fire is ascending in or under said flues. Five other claims are noted, making fifteen in all, in this novel apparatus for desulphurizing ores.

PATENTS can be obtained for citizens on this Coast, through the MINING AND SCIENTIFIC PRESS PATENT AGENCY, in one-half the time it takes to operate through Eastern Agents. From our familiarity with the subject of most California inventions, and the benefit arising from personal explanations, we are prepared to prepare claims with greater accuracy than could reasonably be expected of distant agents. Advice and Circulars FREE.

Patent Agents, 505 Clay street, San Francisco.

WEEKLY STOCK CIRCULAR.—T. F. Cronise, who originated, and for nearly three years conducted the *Weekly Stock Circular*, of this city, has recently disposed of the same to John H. Carmany, who will hereafter continue its publication. The *Circular* has now, for some weeks, been under the management of Mr. Carmany, who has given abundant evidence that he is in every way qualified to keep up the high reputation which this periodical has attained under the able management of his predecessor.

SODIUM AMALGAM.—The company lately organized in New York for the manufacture of sodium-amalgam, for amalgamation purposes, have recently established an office in this city for the sale of the same, and have sent an agent hither to introduce it to the attention of miners. His card will be found in another column. We learn that the singular error which was originally promulgated at the East as a commercial *canard*, to the effect that this material is a dangerous explosive, still continues to obtain credence, to some extent, on this coast, notwithstanding its repeated denial on the highest scientific authority in the country. The amalgam is as innocent of any explosive properties, as a piece of charcoal—in fact it cannot be made to explode. A very interesting discussion, with regard to this new amalgamating agent, will be found on the seventh page of the present issue. Miners and others desiring any further information with regard to this compound, or wishing to purchase the same for mining purposes, should call on Mr. Slosson, at the Union Foundry, in this city.

PACIFIC HYGEIAN HOME.—The object of this new corporation is the treatment and cure of diseases and ailments by the process known as "hygienic medication," and the dissemination of correct ideas upon that subject. Capital stock, \$15,000. Trustees—Dr. Barlow J. Smith, Dr. R. S. Macbeth, and Harry Andrews. The Association have purchased the Fountain Farm near Oakland, where their Institute is to be located. They will shortly open an office and lecture hall in this city, to which will be attached a bathing establishment. Doctor Smith, as consulting physician, will preside at the office and practice in this city, while Dr. Macbeth will have charge of the Home, which is in a pleasant, healthful, elevated and romantic situation, at the mouth of the cañon on the telegraph road, four miles from Oakland. Mr. Andrews, an active, energetic young man, will act as business agent. Dr. Smith, with comparatively limited accommodations, has already accomplished much at Fountain Farm in favor of the hygienic system.

We have never quite outgrown the feeling of delight which we used to experience in the possession of a *new book*, and the display of new, attractive and valuable books in the handsome show-windows of Messrs. A. Roman & Co., Nos. 417 and 419 Montgomery street, is to-day the most pleasing sight that meets our eyes. We advise any who wish to pass a pleasant and profitable half-hour, to visit their large and handsome store. Their house is confined exclusively to the book trade.

"SULPHURETS," and "Our Lady Correspondent," of the MINING PRESS, have each contributed an interesting article on Mines and Mining in Amador county. Hope they will keep up the fire. One of our subscribers complains that "Sulphurets" fell into an error, in stating that the sulphurets of the middle or Jackson range are richer than those on the upper or Pine Grove. He thinks it is just the reverse.—[Amador Ledger.]

STRANGERS visiting San Francisco can use the Burglar Proof Vault of the CALIFORNIA BUILDING, LOAN AND SAVINGS BANK, California street (one door from Sansome street), for the temporary deposit of Gold Dust, Coin, Bonds, etc., at a small monthly rent, according to the value of the property deposited, for which the Company will be accountable.

WORDS FOR MINERS.—The Gold Hill Daily News, Nevada—a medium of good authority—saith thus:

The MINING AND SCIENTIFIC PRESS is a weekly journal, published in San Francisco, which is entitled to the subscription patronage of every practical miner in Nevada, and every person interested in Nevada or California mining operations. It is a well gotten up sixteen-page quarto; and its reading would tend vastly to the particular "posting" and general enlightenment of our sort of working folks. Subscribe for it. Five dollars a year; three dollars for six months. It should have no agency in Virginia and Gold Hill; but we see none advertised in its columns. Every new improvement in mining implements and operations are fully described by words and illustrated by wood cuts in this excellent publication. A specimen number can be seen at our office.

Continued Subscriptions.

For the reason that it is not always practicable to have our agent call upon subscribers for a renewal of their subscriptions as soon as their terms expire, we shall, when requested, continue to send the paper until our Collector calls around. This will only apply to old subscribers in the State of California, whose residences are within our regular canvassing routes. If the subscription is not promptly paid when the Canvassing Agent calls, the paper will be immediately stopped, and the bill left with the postmaster or express agent for collection.

It is not our intention to send the paper beyond the time desired by any subscriber, and should we accidentally or inadvertently do so, we shall expect the subscriber to send us written notice to discontinue.

By Law any person taking a paper from the post office is liable for payment. The Courts have decided that removing without giving notice to the publisher, and leaving the paper uncalled for, is *prima facie* evidence of intentional fraud on the part of a subscriber.

No new subscriptions or renewals received without payment in advance. August 1, 1866.

PHILADELPHIA AGENCY,

Families wishing to subscribe or advertise in the MINING AND SCIENTIFIC PRESS can be accommodated by calling upon our Agent, Mr. TURNER HAMILTON, at the Assembly Building, 106 South Tenth street, Philadelphia, Pa., where sample copies of our publications can always be found.

116 and 118 California street.

SCIENTIFIC AND EXPENSIVE CIGAR LIGHTING.
An English lord, wishing to do a little more than any of his brother aristocrats had done before him, went to a telegraph office in London, and had his cigar lighted by an electric spark from Heart's Content, sent through the Atlantic cable. This feat cost him 200 guineas, or \$1,050 in gold. Some exceedingly scientific persons, who cannot afford the expense of the above, and still loth to light their cigars in the ordinary way, rub phosphorus on the end and then breathe gently upon it. The heat of the breath ignites the phosphorus and lights the cigar. We are anxiously awaiting a plan that will beat this.

THE ANCIENT OPHIR.—It is claimed that the ancient city of Ophir from which Solomon obtained his gold, was situated in that part of Southeastern Africa, lying to the north of Zululand, as the ruins of an ancient city are said to exist there. The tribe living in the locality allow no approach to the ruins, from which it is supposed they procure the materials for the manufacture of certain gold ornaments they are in the habit of wearing.

THE VALUE OF LITTLE THINGS.—Eyelets, that cost but eighteen cents a thousand to manufacture, are consumed to an enormous extent in this country, it being estimated that over \$4,000,000 worth, or at least 250,000,000 of them are annually used for skirts, shoes, corsets, etc.

PETROLEUM EXPORTS.—The exports of petroleum from this country to Europe, for this year, up to the present date, have been four times as large as that of the preceding year. In 1865 there were 7,816,972 gallons exported; in 1866, 30,184,142 gallons have already been shipped.

NITRO-GLYCERINE.—Forty acres of salt meadow land, within a few miles of New York, have been purchased for the purpose of manufacturing nitro-glycerine.

Machinists and Foundries.

PALMER, KNOX & CO.,
Golden State Iron Works,
Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF
MACHINERY,
STEAM ENGINES AND QUARTZ MILLS
DUNBAR'S IMPROVED
Self-Adjusting Piston Packing,
Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.
WHEELER & RANDALL'S
NEW GRINDER AND AMALGAMATOR
HEPBURN & PETERSON'S
AMALGAMATOR AND SEPARATOR,
Tyler's Improved Water Wheel.
Giving the greatest power, at lower cost, than any wheel in use. There are over 1,500 running, giving universal satisfaction.
KNOX'S AMALGAMATORS,
WITH PALMER'S PATENT STEAM CHEST.
Superior for working either Gold or Silver Ores.
Genuine White Iron Stamp Shoes and Dies
Having been engaged for the past eight years in quartz mining and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 15v10q-1f

Notice to Miners, Well-Borers and Water Companies.

PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Pumping devices.
M. PRAG,
8v13-1y Stove Store, No. 125 Clay street, below Davis.
T. G. DUNNING. **J. F. FISHER.**

PACIFIC FILE FACTORY,

No. 53 Beale Street,
Between Market and Mission streets, San Francisco.

FILES RECUT AND WARRANTED AS GOOD AS NEW, or no charge. The only establishment in the State. We also manufacture Reamer and Mower Sections.
8v13-1y **DUNNING & FISHER, Prop'rs.**

LEWIS COFFEY & RISDON,
Steam Boiler & Sheet Iron Works.

The only exclusively Boiler Making establishment in the Pacific Coast owned and conducted by Practical Boiler Makers. All orders for New Work and the repairing of Old Work, executed as ordered, and warranted as to quality. Old Stand, corner of Bush and Market streets, opposite Oriental Hotel, San Francisco.

Postage.—The postage on the Mining and Scientific Press to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and county. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Works, Foundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic Hay, Rice, Screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.
ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.
BOILERS.—Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.
PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's improved Tractory Curvo Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastir Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.
Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner, at the lowest cash prices.
H. J. BOOTH. **GEO. W. FRESCOTT.** **IRVING M. SCOTT.**

H. J. BOOTH & CO.

Vulcan Iron Works Company

(ESTABLISHED 1850.)

First, Natoma and Fremont Streets.

IRON FOUNDERS, Steam Engine and Locomotive BUILDERS.

Boiler Makers, and Workers in Sheet Iron, Brass and Copper.

These Works have lately been increased by the addition of new shops on Fremont Street, doubling the capacity of the original establishment. Their facilities for turning out machinery promptly and efficiently, are now unequalled in the State. Their Boiler Works have also been enlarged correspondingly.

The Company are prepared to execute orders for all classes of Machinery and boiler work, such as

Mining, Steamship, and Steamboat Machinery,

Railroad Machinery, Flouring Mills, Quartz Mills, Car Trucks, Sugar Mills, Car Wheels, Saw Mills, Hoisings and Irons; and

Manufacturing Machinery of Every Kind.

Sole Manufacturers of

HEPBURN & PETERSON'S REDUCING PAN AND AMALGAMATOR;
BEATTY'S AMALGAMATOR;
HESE & MOORE'S IMPROVED HOWELL QUARTZ CRUSHER;
BAUX & GUIOD'S AMALGAMATOR AND SEPARATOR;
FAUCHER'S QUARTZ GRINDER AND WATER WHEEL;
JOYAL'S IMPROVED WATER WHEEL;
LEFFEL'S AMERICAN DOUBLE TURBINE WATER WHEELS.

STEVEN'S PISTON PACKING RINGS.

They have also a large assortment of Patterns for Pumping and Hoisting Machinery, Gearing, Pulleys, Water Mill Irons, Hydraulic and Screw Presses, Retorts, Furnaces, Grate Bars, House Fronts, Ornamental Fence Posts and Paling, Stove Ranges, etc., etc.

Quartz Stampers, Shoes and Dies, of the best Hard Iron. Quartz Screens of Russia Iron Punched to Order. 27

MACHINERY OF EVERY DESCRIPTION MADE AND REPAIRED.

Special attention paid to Repairing. 47-3

Pacific Forge Company.

FORGING AND IRON WORK.

THE PACIFIC FORGE COMPANY HAVE JUST ERECTED in this city, on Fourteenth street, near the machine shop of the San Jose Railroad, a large establishment for the purpose of forging and working in wrought iron. Our hammer is the largest upon this coast, and we are prepared to manufacture, at short notice, all kinds of heavy forgings, car axles, shafts, steamboat cranks, piston-rods, wagon axles, and other similar work. This is the first general shop of the kind erected in this State, and we solicit the patronage of the public. All orders executed at reasonable rates, and with promptness and satisfaction. 19v12-3m

Our Patent Agency.

THE PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of Letters Patent from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

J. O. HANSCOM & CO., (T. PENDERGAST, H. S. SMITH, W. W. HANSCOM.)

Etna Iron Works!

Southeast corner Fremont and Tehama streets, SAN FRANCISCO.

Practical Machinists and Iron Founders, MANUFACTURE

STEAM ENGINES,

QUARTZ MILL MACHINERY OF ALL KINDS,

SAW MILLS, FLOUR MILLS,

Dunbar's Improved Self-Adjusting

PISTON PACKING,

Now so extensively used in the East and in this State. Requires no springs or screws; is always steam-tight; without excessive friction, and never gets slack or leaky.

HANSCOM'S CRUSHER,

The best of the kind now in use in this State or anywhere else

Wheeler & Randall's New Grinder and Amalgamator,

Which only needs examination to be appreciated.

Tyler's Improved Water Wheel,

Giving greater power, at lower cost, than any wheel in use

for one of our clients, giving full tables.

All Wheels warranted to give the power as set forth, or the money will be refunded.

Sole makers for this coast of the "Pendergast White Iron Stamp Shoes and Dies."

None genuine unless obtained from us. Every one warranted.

Patented Machinery of all kinds will be furnished by us at market prices. Particular attention given to drawings and specifications of machinery, which will be made to order. The patronage of the public is respectfully solicited. 19v12

Francisco for the last fourteen years, and enjoys the reputation

of having built ONE HUNDRED AND SEVENTEEN

STEAM ENGINES.

Screw Propellers of all kinds, and Steam Boat Machinery

generally made to order, and warranted to give perfect

satisfaction in every particular. 25v12-3m

MINING SUPERINTENDENTS.—We think the Copperopolis *Courier* is unnecessarily sensitive in its review of a letter from Copperopolis, which we published in our issue of July 21. We never endorse the views of our correspondents, but leave them to stand or fall upon their own merits. We regret that any unpleasant feelings should have been generated by the communication in question. Did space permit, we would give the article from the *Courier* in full; but as it is, the following extracts must suffice:

If an unpopular "mining engineer" loses, through want of common sense, a remunerative occupation, that same mental deficiency is apt to create in his bosom an envious feeling toward his more intelligent and reliable successor. Narrow minds are generally illiberal, and are therefore well adapted to fault finding. We will say this much of the superintendents of the mines mentioned in the communication: Mr. Balch, of the Union, is a practical man. It is generally conceded that no other man on the Pacific Coast can occupy his position with equal ability. The Union mine, under his superintendency, is the best worked mine we have ever seen, not excepting the mines of Washoe.

The errors of former superintendents have or will cost the Keystone company perhaps \$150,000. Under the supervision of Mr. Sheldon, the present superintendent, the mine is being opened in a manner satisfactory to the judgment of the most practical miners. Mr. Sheldon is a scientific miner. His practical knowledge is the result of long experience, and his scientific attainments that of constant study. He, unlike many worthless superintendents we have seen, keeps no crack nugs. He is a modest, unassuming gentleman, and knows more in one hour than the dictator of the communication referred to ever did or will know in his life.

The superintendent of the Napoleon mine, Mr. Leeds, is an excellent miner, a good business man, and a gentleman withal. He is well known among miners and scientific men, and has the reputation of being one of the most skillful men of his profession in the United States.

STILL MORE OF IT.—The *Amador Ledger*, in alluding to an article which we published a few weeks since, in reference to a new description of mineral deposit, which is now attracting considerable attention in Placer and Calaveras counties, says: "The Coney mine near Jackson, is unquestionably of the same character. For two years past it has yielded by battery about six or seven dollars per ton, and ten per cent. of sulphurets, worth at the mill from \$150 to \$200 per ton. One or two other mines of the same kind have lately been discovered in the county, and are likely to prove immensely valuable. Prospectors should closely study the nature and general features of these mines, as those unacquainted with them would never suspect them as being of any value. The miners of El Dorado and Calaveras, who have so long searched in vain for quartz mines among their ancient rich placers, will find that 'that's the truck' in which their treasures are concealed."

WM. H. KEITH & CO., Chemists and Apothecaries,

PROPRIETORS AND MANUFACTURERS OF

WM. H. KEITH & CO.'S WINE OF PEPSINE, OR RENET WINE, a new and efficacious remedy for Dyspepsia, Catarrh, etc. WM. H. Rheumatism!! ANOTHER WITNESS!

SALMON FALLS, June 17, 1886.
H. BOWMAN—DEAR SIR: HAVING HAD A FAIR test of the virtues of RICHARDS' REMEDY FOR RHEUMATISM, I take great pleasure in stating that its effects upon me have been even better than its recommendations claim. In 1883 I first heard of the Medicine. I had then been for three years severely afflicted with Rheumatism, and having tried everything I could hear of, without any permanent benefit, I concluded to try this also.
On taking the medicine, in three days I experienced great relief, and in one week was entirely free from pain, and had completely recovered the use of my limbs, which had become almost powerless, so much so that I could not dress myself without assistance. Since that time I have been free from Rheumatism. I have recommended RICHARDS' REMEDY to numerous friends, and in every case it has proved successful. I therefore take great pleasure in recommending it to all who are afflicted with Rheumatism, and especially to all who are afflicted with chronic Rheumatism cases.
Yours respectfully,
(Signed) ERASTUS PARSONS,
President of the Gen. Grant Mining Company.

22 RICHARDS' REMEDY is for sale by
H. BOWMAN,
Druggist, Sacramento, 11113
Price, \$2.50 per Bottle.

HAYWARD, COLEMAN & CO., IMPORTERS AND REFINERS —OF— Illuminating, Lubricating, —AND— PAINT OILS!

CONSISTING OF
KEROSENE, LARD, SPERM, ELEPHANT, POLAR, TANNERS', NEATFOOT, BOILED AND RAW LINSEED, CASTOR AND CHINA NUT.

—ALSO—
SPIRITS OF TURPENTINE & ALCOHOL

NOTE.—We would specially call the attention of Mill owners and Engineers to our superior PARAFFINE OIL, which we manufacture from the California Petroleum. This Oil will not gum. Machinery thoroughly cleaned and lubricated with it will not heat, and after remaining at rest, can be started without cleaning oil.
A sample can of our Paraffine Oil will be forwarded on application to us, as we desire a fair and impartial trial.

Lamps and Lamp Stock!
An elegant and complete assortment on hand.
413-3m19 414 Front street, San Francisco.

THE CALIFORNIA Aerated or Unfermented BREAD COMPANY.

Bakery on Folsom Street,
Between Tenth and Eleventh.....SAN FRANCISCO

MESSRS. TAGGART, BULKLEY & DUFF, HAVING ASSOCIATED themselves in partnership, are happy in announcing to the public that they are now prepared, and would respectfully solicit all orders for their truly wholesome and cleanly Bread. We have a sufficient number of delivery wagons at our bakery to guarantee to all who may favor us with their patronage a prompt delivery of fresh bread daily, Sundays excepted.
Through the kindness of the gentlemen of the following named firms, we are privileged to keep an order box for the entry of all orders for the bakery so that they may reach our earliest attention:
Order box at C. J. Hawley & Co's Grocery, corner Second and Jessie streets; Rowland & Walker 547 Clay street; Plim's Carpet Store, Montgomery street, opposite Dick House; E. W. Clark, Paper Hanging, corner Sansome and Clay streets. Orders handed to any of the route-men likewise. We expect soon to be prepared to supply Pastry, likewise the Boston Brown Bread, and Beans of the first quality. Due notice will be given.
The present Company is entirely independent of the former California Unfermented Bread Company, neither of them having been in any way connected with that company.

We would cordially invite the public to make a visit to our new bakery.
413-3m S. R. BULKLEY, Business Partner.

EUROPEAN METALLURGICAL WORKS,

—AND—
Practical Mining School,
Bryant Street, Between Third and Fourth,
SAN FRANCISCO.

THE PROPRIETORS are at all times prepared to work or test 1 Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyrites, and (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, rolling by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

And in accordance with law, and an order of the Board of Trustees, made on the third day of August, 1886, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesrooms of Maurice Dore & Co., on Tuesday, the second day of October, 1886, at the hour of 12 o'clock M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

C. HEYWOOD, Secretary.
Office, 311 Market street, San Francisco, Cal. se15

Mina Rica de las Flores Mining and Mill Company, Camp Flores, near West Point, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-first day of August, 1886, an assessment (No. 13) of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, S. Dickinson, at the office of the Company, No. 423 Washington street, Room No. 13, up stairs, San Francisco, Cal., between the hours of 11 A. M. and 1 P. M.

Any stock upon which said assessment shall remain unpaid on the second day of October, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fifth day of November, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

S. DICKINSON, Secretary.
Office, 423 Washington street, San Francisco, Cal. au25-5t

Nuestra Señora de Guadalupe Silver Mining Company, Tayoltita District, Durango, Mexico.

Notice is hereby given that at a meeting of the Board of Trustees of said Company held on the twenty-fifth day of June, 1886, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. Pfeiffer, at the office, No. 210 Post street, or to the Treasurer, A. Himmelfarb, at his office, No. 637 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the first day of October, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the thirty-first day of October, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

E. J. PFEIFFER, Secretary.
Office, 210 Post street, San Francisco, Cal.

N. B.—The above is assessment No. 24, levied on June twenty-fifth, 1886, and now re-advertised, in accordance with an order of the Board of Trustees, at a meeting held on the thirtieth day of August, 1886. The omission to comply with the order of the Board of Trustees, in the first order, occurred by delay in order to receive news from interested parties in New York.

San Francisco, August 30th, 1886. se1

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Müller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; a, Dies; c, Shoes; and o, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan when properly constructed, are respectively 177, 118 and 132.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes direct from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been bruised. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works.

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the

PACIFIC FOUNDRY,
San Francisco.

LEFFEL'S American Double Turbine

THIS WHEEL, WHICH HAS HAD THE most unexcelled sale of any water-wheel ever made, and which has given universal satisfaction whenever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 600 feet fall. Let us know how much water you have either in miner's inches or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to

KNAPP & GRANT,
San Francisco.

Leffel's Lever Jacks,

For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks, for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind. For sale by

KNAPP & GRANT,
San Francisco.

PAGE'S PATENT FOR RAISING SUNKEN VESSELS!

SHIPPING AND INSURANCE COMPANIES, and other parties upon this Coast or in the Atlantic States, having occasion to avail themselves of this invention, which has been tried and proved a success, will please address, for the present, JOSEPH DEVIN & CO., San Francisco, or at the office of the MINING AND SCIENTIFIC PRESS, 8v13

AUSTIN Z. PAGE, Patentee.

Book Printing should be considered and treated as one of the higher branches of the "Art of Arts," and its execution entrusted only to experienced and intelligent workmen. Strict attention will be given to all orders for Book and Pamphlet Printing entrusted to the Mining and Scientific Press Job Office.

BAUX & GUIOD'S Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1884, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine Scientific Knowledge with Practical Experience, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgamators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by Baux & Guiod's Pan are the following: The trifling cost for attendance; its small cost; its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Grail's Gravel Cement Works, Nevada county; Waltham's Chlorination Works, Nevada; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Hugh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v3-6d

It tells us truly the Minute, Hour, Day of the Week and Day of the Month.

HORTON'S PATENT CALENDAR CLOCK!

MANUFACTURED BY THE

ITHACA CALENDAR CLOCK COMPANY,

Ithaca, N. Y., and for sale by

W. J. EGBERT, Agent,

At Job M. SEAMAN & CO'S, 631 WASHINGTON STREET,
San Francisco.

THIS TIME PIECE costs but a trifle more than any other good clock, and is just the article for every well-regulated business house, office, saloon, or, in fact, any place where a handsome, perfect time-keeper is duly appreciated. The Clock has two dials, the first being the same as an ordinary clock; the second has but one pointer, and shows the day of the week, the month and day of the month. It is arranged to mark the days in leap years with equal regularity. It is an eight-day piece, and runs from year to year without change. It can be examined at the Office of the Mining and Scientific Press.

2v13p16-1f

To Ditchmen, Millmen and Others Requiring IRON PIPE.

M. R. ROSE, CORNER OF 9TH AND K STREETS,
San Francisco, has facilities unsurpassed on this coast for the manufacture of IRON PIPE of every description. He also has on hand a deep well FORCE PUMP, of his own invention and manufacture, well adapted for oil wells. His tools being portable, pipe can be manufactured on the ground.

19v12

EXCELSIOR PUMP!

HOOKER'S PATENT!

CHALLENGES COMPETITION!

THIS DOUBLE-ACTING SUCTION AND FORCE PUMP CHALLENGES COMPETITION, for simplicity, durability and power, and will work at any depth. The pistons for Mining Pumps are packed with hemp. The valves are reached by simply removing the "bonnets," thereby avoiding the trouble of raising a long column of pipe. They will raise as much water as TWICE their size of single-acting Mining Pumps, and are sold at half the price. We have never heard of the valves in this Pump being out of order. For their many superior points they are fast replacing all other Force Pumps. Reference can be given where this Pump is working with eighteen others of different patterns and is pronounced THE BEST; also, from some of the best miners in the State who have them in use. For manufacturers, farms or domestic use, we warrant them the best and cheapest. All sizes adapted to any power or any purpose. For sale by agents throughout the State.

J. W. BRITAN & CO.,

General Agents,
120 Front street, San Francisco.

June 23, 1885.

Union Amalgamator.

This Valuable Invention

ITS FAST FINDING ITS WAY INTO GENERAL USE, NOT by means of combination of capital and influence, but on the strength of its own merits, and upon the principle that what is known to be good will be appreciated. Practical men acknowledge the UNION PAN to be scientific, the best, the cheapest, and most profitable. It now stands first on the list of all pans in use for the purpose of

Working Gold and Silver Ores.

It has been found that a low class of ores, also tailings from Mills, Sulphurets, etc., that will not pay to work with the common pans, may be worked with this and obtain large profits. The UNION PAN is manufactured in two sizes, and capable of operating upon large quantities of ore in the most efficient manner.

Parties interested in Quartz Mining, Mills, etc., will find it to their advantage to call and examine for themselves, and see its operation.

Gold and silver ores tested by regular mill process, at moderate cost, by

STRONG & CO.,

San Francisco Foundry, corner Mission and Fremont streets, where orders will receive prompt attention.

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most economical mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

ARTIFICIAL GAS COAL.—Experiments have recently been made at Glasgow, Scotland, in forming an artificial gas coal for the use of the gas companies of that city. The novelty consists in merely mixing the fine waste coal of the mine with the heavy oil and waste viscid mass derived from the manufacture of petroleum. The result obtained is a combined material, one part deficient and the other rich in carbon, just the conditions desirable. The cost of the ordinary gas coal is 30s. per ton, with a yield of 9,000 cubic feet of gas. The cost of the new material is 20s. per ton, with a yield of 16,000 cubic feet, fully equal in illuminating power to the other. The resulting coke from the natural coal is sold at 5s. per ton for household purposes; while the coke from the artificial coal is in demand at 20s. per ton for foundry purposes. Thus, every element in the operation appears to range on the side of economy. The results are spoken of as likely to prove of incalculable value to both the gas companies and the crude oil manufacturers.

THE AGRICULTURAL COLLEGE.—On the 7th inst., the State Board of Directors, presided over by Gov. Low, met at the Occidental Hotel in San Francisco, for the purpose of opening and examining the bids of the different counties for the location of the same. Two bids were received from Santa Clara county, as well as proposals from Alameda and Sacramento. Before a decision is made in the matter the Board will personally visit the locations offered. The Board meets for this purpose on the 15th of October.

THAT very innocent and much abused animal, the toad, is at length beginning to be appreciated. It is now becoming generally known that it is one of the best protectors the farmer and gardener can possibly have against the depredations of insects. Their claims to life, liberty and the pursuit of bugs, are fast being recognized in England, and large numbers are being exported from France to supply the rapidly increasing demand. Once on British soil, they are retailed at the rate of \$1.50 per dozen.

TABOOSH.—The Sacramento Union has recently sent a small sack of taboose, an article never before exhibited in that city. Taboose is a small nut or root about the size of a pea, which grows on the eastern slope south of Aurora, and tastes very much like a chestnut. It grows in strings a foot or foot and a half long, and is extensively dug and eaten by Indians. A small portion of this seed will probably be furnished the State Agricultural Society.

COPPER WORKS.—From the report of the eight census it appears there are seven establishments in the United States for copper rolling. These establishments employ 413 hands, and have a capital invested of \$2,470,000. The cost of material consumed by them is valued at \$2,557,000, the cost of labor at \$157,050, and the annual value of products for the year ending June 1st, \$3,196,788, of which Pittsburgh gave one fifth.

Auction House.—Messrs. Olney & Co. have opened a General Auction and Commission House, No. 418 Montgomery street—very central and convenient location. Mining and other Corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Besides every kind of auction business, this firm will pay special attention to the purchase and sale of real estate in Oakland.

STOCK CERTIFICATES, STOCK TRANSFER JOURNALS, STOCK LEDGERS,

ASSESSMENT RECEIPTS,

And all other Blanks, Blank Books, etc., required by Mining and other Corporations, kept on hand or printed to order on short notice, at moderate prices, at the office of the MINING AND SCIENTIFIC PRESS.

At the Golden State Iron Works, No. 19 First street, San Francisco.

CAUTION!

NOTICE.—TO WHOM IT MAY CONCERN.—THE PUBLIC are hereby notified that a patent was allowed Dec. 27th, 1881, and issued June 27th, 1883, to Professor HENRY WURTZ, for the use of Sodium and Amalgams thereof with quicksilver, in the extraction of precious metals from their ores. All persons using said Amalgams, or purchasing or selling Sodium or said Amalgams for use in the treatment of gold or silver ores, are hereby cautioned that they will be prosecuted to the full extent of the law.

SODIUM OR MAGNETIC AMALGAM.

THE WURTZ AMALGAMATION COMPANY,
OF NEW YORK,

Assignees of letters patent granted to Prof. HENRY WURTZ, the discoverer of the use of Sodium in the amalgamation of gold and silver ores, having established an agency in San Francisco, now offer to the mining community their amalgams, with full directions for their use, on the MOST LIBERAL TERMS. A large supply of the Amalgam, of any required strength, constantly on hand.

The terms and conditions upon which rights to use the process are obtainable, can be had on application to
WM. SLOSSON,
Agent of the Company, Union Iron Works, corner of First and Mission streets, San Francisco. 5v13

NEW YORK PRICES.

C. E. COLLINS,
No. 603 Montgomery street, San Francisco.
EXCLUSIVE AGENT
FOR THE
AMERICAN
WATCH FACTORY.
A large assortment of these
Superior Watches,
In Gold and Silver Cases,
Constantly on hand, and sold at Factory prices. Also,
ENGLISH AND SWISS WATCHES,
Imported directly from the Manufacturers.
The American Company are now making
VERY FINE WATCHES FOR LADIES.
A large assortment of Gold Chains and Jewelry. 25v10-6m

WATCH REPAIRING AT NEW YORK PRICES.
WATCH REPAIRING AT NEW YORK PRICES.

STANDARD SOAP COMPANY'S WASHING POWDER,

THIS POWDER IS SUPERIOR TO ALL OTHER PREPARATIONS for washing and cleansing. It is made of pure material, and contains nothing that will injure the finest fabric. Equally as good for use in hard as soft water. One pound will make three gallons of beautiful soft soap. Put up in wrappers of 1 lb each, and in wooden boxes of 10 lbs bulk. Ask your grocer for a package, and test its virtue. Manufactured at 207 Commercial street, San Francisco. 15v12q

WE ARE NOW OFFERING OUR IMMENSE STOCK

Fine Custom Made Clothing

Gents' Furnishing Goods

AT PRICES THAT DEFY COMPETITION.

Our Stock of Clothing Consists of
ALL THE LATEST STYLES

BOTH OF MATERIAL AND FINISH.

A Large Assortment of

Trunks, Valises, Carpet Bags, Blankets, Etc.,

AT EXTREMELY LOW PRICES.

J. R. MEAD & CO.,

Cor. of Washington and Sansome streets.

8v10

THIS CUT REPRESENTS AN AMALGAMATOR and Separator that has stood the test of eight years' practical working in the gold mines of California, and for nearly the same time in the silver mines of Nevada, having been introduced into the first steam mills built in the latter Territory, since which time they have been successfully working against all competition.

The great advantages these Amalgamators have over any others, are—

1st. Much less Cost.

2d. They do not "flour" the mercury, and collect any that may have been "sickened" in the battery or grinders.

3d. The "shaking" motion given to the pulp (by the revolution of the mill under the stationary frame) against the amalgamated copper plates that are fastened to the frame, and by this means catching the fine gold and mercury that will not settle.

4th. The gate in the cone, through which the pulp is discharged, from the top, and where there is the least motion, almost precluding the possibility of any granulated mercury or fine gold escaping.

There are over 500 of them in use in California and Nevada, where those interested can see their practical workings.

ISRAEL W. KNOX, or
W. A. PALMER, Inventors,

ANNUAL REPORT

Pacific Insurance Company.

IN COMPLIANCE WITH THE ACT OF THE LEGISLATURE of the State of California, entitled "AN Act concerning Corporations," passed April 22, 1880, the Pacific Insurance Company of San Francisco makes the following Annual Report:

I.—The amount of the Capital Stock of this Company is SEVEN HUNDRED AND FIFTY THOUSAND DOLLARS, and paid in GOLD.....\$750,000
II.—The amount of the Assets is ONE MILLION AND FIFTY-ONE THOUSAND, FOUR HUNDRED AND TWENTY DOLLARS AND THIRTY SEVEN CENTS, \$1,051,420.37
III.—The Company has NO DEBTS.
IV.—The amount of insurance effected during the year, and which remained in force December 31, 1881:
Fire.....\$12,975,949
Marine.....481,403
This Company commenced underwriting Marine Risks, August 1, 1880.
V.—This Company insures against the following risks, viz: BUILDINGS, HOUSEHOLD FURNITURE, MERCHANDISE, RENTS, LEASEHOLD, VESSELS IN PORT AND THEIR CARGOES, and other PERSONAL PROPERTY, AGAINST LOSS OR DAMAGE BY FIRE.
Also, on CARGOES, TREASURES, COMMISSIONS, PROFITS, AND WARE HOUSES, ON ALL MARINE AND LAND NAVIGATION RISKS, TO AND FROM ALL PORTS IN THE WORLD.
VI.—This Company will take on any FIRST-CLASS RISK not to exceed \$75,000 (the limit fixed by law), and on all large risks will reinsure to an extent consistent with PRUDENCE in other RESPONSIBLE COMPANIES.
J. HUNT, President.
A. J. RALSTON, Secretary.

Brodie's Patented Improvements FOR THE TREATMENT OF Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER.
The attention of all interested in Mining is respectfully called to this Improved Machine for breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertiser is enabled to offer these machines to the public at the following low terms:

No. 1.—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600
No. 2.—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour.....850
No. 3.—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour.....1,200

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics Institute in San Francisco, in 1881. Further particulars will be applied on application to the subscribers.

The inventor of the patent rights to the above Improved Barrel, are hereby informed that on and after the 1st of November, 1882, the royalty charged for using the same will be raised to the sum of \$100 per Barrel.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1880.

BRODIE & RILEY,
Express Building, 422 Montgomery street, San Francisco. 12v13-11

Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

HOADLEY'S.

FOUR SIZES,

8, 10, 12, and 15-Horse Power,

HOADLEY'S.

3 to 40-Horse Power.

HITTINGER'S.

THREE SIZES,

5, 7, and 10-Horse Power

HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes. Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern machines which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with an without carriages.

Also, Portable Saw and Grist Mills.
For sale by
TREADWELL & CO.,
15v12
Corner of Front Market and streets.

CRALL'S WALTZING PAN.—We learn by letter from Mr. Crall, that the negotiations between the proprietors of Crall's Waltzing Pan and the Hadsbrow Planetary Pan, which we last week supposed were consummated, have failed of that end. The principle on which the waltzing and planetary pans operate appear to be the same in some respects; but we understand that the proprietors of the former intend to make certain alterations and improvements in *their* pan, so as not to interfere with the latter; after which they will proceed actively in their manufacture and introduction into the mines.

New Mining Laws of California and Nevada.

We have just issued, in cheap edition, the new laws relating to mining and corporations in California and Nevada, passed in 1865-6. Some of these laws are of the highest importance to parties interested in the matter of locating and holding claims, and prospecting mines, in these States. Copies sent by mail. Price, 25 cents. Address, DEWEY & CO., Patent Agents. San Francisco, May 1st, 1866.

MINING AND SCIENTIFIC PRESS.—The paper whose name we have just written, ranks among the leading scientific journals of the world. On mining matters it certainly has no equal, and more than all other causes combined, it has advanced the interests of the quartz miners of the Pacific Coast. Its editors are men of thorough education and large practical experience, and its list of contributors embraces many names distinguished in the various fields of scientific exploration and mechanical invention. The MINING AND SCIENTIFIC PRESS ought to circulate universally among intelligent Californians, to whom we most cordially commend it, and its traveling agent, O. P. Traudell, who is now canvassing this city and county, and will shortly visit other counties in the southern part of the State, in its interest.—[Stockton Daily Independent, Sept., 1866.]

PATENT BUSINESS.

We have lately associated with us in the Patent and Mechanical Department of the MINING AND SCIENTIFIC PRESS, a gentleman of superior ability and attainments, who has arrived direct from the leading patent agency in New York City, and having a faithful and reliable associate in Washington City, we are now better than ever before prepared to secure the claims of our applicants, in a careful, prompt and efficient manner. DEWEY & CO., Patent Solicitors. San Francisco, June, 1866.

THE MINING PRESS comes loaded with a rich variety of mining intelligence, and all sorts of scientific interesting matter.—[Amador Ledger.]

Pacific Mail Steamship Co's

THROUGH LINE TO NEW YORK,

Carrying the United States Mail.

LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the 10th, 18th and 30th of each month that has 30 days.

On the 10th, 19th and 30th of each month that has 31 days.

When the 10th, 19th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departures of 14th or 18th connect with French Trans-Atlantic Co's steamer for St. Nazaire, and English steamer for South America.

Departure of 19th connects with English steamer for Southampton, and P. E. R. Co's steamer for Central America.

Departure of the 30th connects with English steamer for unaco, the port of the new mines.

The following Steamships will be dispatched on dates as given below:

September 29th.—SACRAMENTO. Capt. J. M. Cavarly

Connecting with OCEAN QUEEN, Capt. Weir.

Cabin passengers berthed through. Baggage checked through.—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Inman Line, can be obtained at office P. M. S. S. Co., San Francisco.

For Merchandise and Freight apply to Messrs. WELLS, FARGO & CO.

The splendid steamship COLORADO will be dispatched for CHINA on TUESDAY, January 1, 1867.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

OUR NEW YORK AGENCY.

Mr. Geo. M. Newton is our authorized agent in New York City, and will receive advertisements and subscriptions for the Mining and Scientific Press at regular rates. Sample copies of our weekly and monthly issues can be procured by calling upon him, at the office of the "Stockholder," No. 72 William street.

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three months delay requisite in transacting business through Eastern agencies.

[Reported for the Mining and Scientific Press.]

California Academy of Natural Sciences.

REGULAR MEETING, Monday, Oct. 1, 1866.

President in the Chair.

Fourteen members present.

Minutes of previous meeting read and approved.

Messrs. Winslow Boynton and T. C. Leonard were elected resident members.

Mr. Albert L. Bancroft was nominated for resident membership.

Donations to Cabinet: Specimen of black oxyd of manganese from Red Rock, San Francisco Bay, presented by Mr. Stearns; fossils from the banks of the Nauaimo river, also fossils from Prospect Island, opposite the town of Nanaimo, presented by Dr. P. Comrie, of H. B. M. ship Sparrowhawk.

Donations to Library: Seven volumes of the publications of the Smithsonian Institute, presented by Samuel Huhhard.

Royal Fisk sent in his resignation as a member of the Academy.

Dr. Behr made some remarks upon the *Lepidoptera* and the four different stages of their development, noticing the fact that the length of time of the egg state in some species, for instance, the Chinese silk-worm, admitting of the transportation of the same to foreign countries, while in the California silk-worm the *Saturnia ceanothi*, the period of the egg state is so brief as to render it impossible to transport the eggs either to New York or Europe. Dr. Behr also explained the difference between the larva state in the *Lepidoptera* and other classes of insects and referred to the importance of the larva condition in insects, as a basis for classification, and mentioned many interesting proofs of the tenacity of life during the *crysalis* or *pupa* state; alluding to the different classes of Moths in which wingless females occur, a peculiarity that is unknown to the butterflies.

Mr. Bolander stated that in a paper laid before the Academy some time ago, he had maintained that there was but one species of live oak in the valleys of California; he now wished to correct that statement, as he felt satisfied the species described by Dr. Englemann as *Quercus wislizeni* was a good species of the live oak.

Mr. Bolander further remarked the distribution of many species of California forest trees, and many interesting geographical and geological facts in connection with many species of the trees of this State, especially the *pinus* and *Sequoia*. Adjourned.

T. H. BLOOMER, Secretary.

READ the advertisement of the Family Medicine Chest. Such a thing has long been needed. The wisdom of providing the house with this chest is obvious to all. These chests can be obtained at the lowest rates by addressing this office.

WRIGHT'S DIRECT ACTION STEAM STAMPING MILL.

Mr. William Wright, superintendent of the New York Steam Engine Works, recently devised and applied for a patent for a steam

trough, A, cast in the bed plate of the mill. The ore to be crushed is fed in through a hopper, M, and so distributed equally to all, and as fast as it is pulverized finely enough, it is delivered on all sides through the screen into

fitted to screw-threads on the said pillars, for the purpose of adjusting the clearance between the pistons and the top and bottom of the cylinder, and for maintaining a uniform clearance by lowering the cylinders as the stamps wear

away, and allow the pistons to descend lower. The steam acts above and below the pistons, so that it not only lifts the stamps, but the force of its downward pressure on the piston is added to that due to the weight and fall of the stamps.

Each cylinder has an independent valve and automatic valve-gear, so that each piston and stamp may work independently of all the others. The valves are short double-faced slides, working horizontally in the chests, H, and operated partly by the steam and partly by conical surfaces on the upper parts of the piston and stamp-rods, which pass upward beyond the tops of the steam cylinders into closed central caps, J, J, on the cylinder covers. The conical parts of the rods act upon the valves through levers I, I, and attached slides. This method of operating the valves permits the stamps and pistons to turn freely as required.

The cylinders are 5½ inches diameter, and the pistons have from six to eight inches stroke, according to the depth of material in the battery. The machine is estimated at about 30-horse power, and the inventor claims that it will crush thirty tons of ore in twenty-four hours.

These mills are built at the New York Steam Engine Works, East Twenty-third street, New York, and were first illustrated and described in the New York *Artisan* of July 4th, 1866.

We have reproduced the illustration, in order that our readers may be kept posted as to the improvements, alleged or real, which are being made in quartz machinery on the Atlantic side of the continent.

RETURNED.—Gen. McDowell and party have returned from their tour of military inspection from across the Sierras, by way of the Visalia route. We learn from Professor Blake, who was one of the party, that the General extended his tour of observation through and beyond the Mono Lake country, to near the borders of Pahrangat. He must have had a rough time

of it; but doubtless gathered much information which will be valuable to the government in its future military operations in that quarter. We presume that the scientific observations of the Professor will not be without their value in the same direction, as well as to the cause of science in general.

A FIELD OF WHEAT buried under an avalanche in Switzerland for twenty-five years, is said to have proceeded on its growth as soon as the snow melted.

WRIGHT'S DIRECT ACTION STEAM STAMPING MILL.

stamping mill for crushing ores and other material, in which the stamps are operated by the direct action of the steam, by the stamp-lifters being connected, each with a steam piston working in its own cylinder. An illustration of this machine is given herewith:

The stamps, K, K, which are attached directly to steam piston rods, are arranged in a group four in number, and surrounded by a screen, L, the front of which is omitted to expose the stamps to view. The battery in which the stamps work is surrounded by a

trough, A. The stamping is done wet, and the very finest portion of the powder is washed over from the trough, A, by the overflow of water through spouts into an outer surrounding trough or gutter.

There is a separate steam cylinder and piston for each stamp. The cylinders are all cast together with a surrounding exhaust steam-jacket, G, and sole plate, C, and are supported on wrought-iron pillars, B, B, erected upon the bed-plate, A; and all the cylinders can be adjusted simultaneously by means of nuts, E, F,

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

Notes on the Chief Gold Districts Throughout the World.

BY PROFESSOR ROWLANDSON, F. G. S. L.

(Continued from Page 173.)

AMERICA.

I have deferred the consideration of the gold fields of this Western Continent until a sketch had been drawn of those found in other parts of the world. I commence with those of

CANADA AND NOVA SCOTIA.

Gold has been found in Western and Upper Canada. About fourteen years ago, considerable hopes were entertained that certain districts in the Canadas would prove highly auriferous. Somewhere about \$3,000 worth was transmitted to the Colonial office, and was shown to the writer by the late Sir Henry de la Beche. It was what would be called coarse placer gold, the size running from that of small spangles or lentils, to that of large-sized peas or small horse-beans. It was of a dull copper color and rough exterior, greatly resembling the gold usually found in placers which had been formed by the disintegration of adjoining granitic rocks, and consequently under not greatly different conditions to that which was usually found to occur in the subsequently discovered gold fields in the adjoining provinces of Nova Scotia.

THE UNITED STATES—OHIO.

Professor Richardson, of New York, a few months ago, in a private letter, referred to some placer gold fields which have been recently discovered in Ohio; an extract of the communication, containing the particulars thereof, has already appeared in the Press. Judging from the details there given, it is highly probable that the geological features connected with the Ohio gold field bear a considerable resemblance to those associated with the Canadian and Nova Scotia placers.

VIRGINIA, GEORGIA, NORTH AND SOUTH CAROLINA.

The consideration of the conditions under which gold is found in the above-named four States bordering on the Atlantic, may conveniently be taken together. When thoroughly examined, it is very probable that the geological circumstances under which gold is found in those States, will not greatly vary from those associated with the country extending from the western slope of the Rocky Mountains to the Pacific, interesting differences, both in an economic, as also in a scientific point of view, will doubtless be discovered; but the chief geological accompaniments, which will be found on both sides of the great dividing ridge alluded to, so far as the United States is concerned, will probably, on future investigation, be found to agree; and further, that the date of the formation of the gold vein in both the Eastern and Western divisions, is not greatly dissimilar. Triassic, Cretaceous, and Tertiary rocks are found, as on the Pacific Coast, in each of the States named, and frequently not far distant from the gold fields situated in the different States alluded to. As, however, with gold and many other metallic-producing veins, the enclosing rocks are there also highly metamorphosed and occasionally crystalline, so much so that it is very difficult or quite impossible to discover their age from fossil evidence. The following interesting fact, which, however, is now pointed out more with the object of inducing local geologists to carefully examine the matter, rather than for the purpose of drawing any special inference therefrom in the present paper, may probably, when fully inquired into, elucidate many points of great interest: Bituminous coal of good quality occurs in Virginia, the shales of which are found in direct contact with granite and gneiss. It is impossible that such a circumstance could occur, unless the granite, etc., had been formed prior to the deposition of the incumbent coal. The interesting problem which it is desirable should be solved, is this: Was the chief, or any of the gold veins found in

the surrounding region, formed at the same time and by the same agency as the inferior granitic rock, and prior to the formation of the overlying coal? The writer is induced to believe that when this question has undergone a careful examination on the spot, by competent parties, it will be found that the gold veins found in the States now under consideration, were formed subsequent to the sub-carboniferous granite—probably post-Cretaceous, or even tertiary; with a strong probability that many of the veins, especially those found near the junction of the two Carolinas, are enclosed by rocks belonging to one or both of the latter named formations; whilst in Virginia it is not improbable that much of the gold-bearing districts will be found composed of carboniferous rocks, as is the case with portions of California and parts of Nevada. The association of gold with copper ore, so prevalent in North Carolina, together with other circumstances connected therewith, bear a strong analogy to many similar cases in

COLORADO, IDAHO, MONTANA, ETC.

As yet we know very little of the geological associations of gold and silver veins in the districts named in the above sub-heading. Unless, however, these circumstances vary greatly from the geological features generally found connected with the Rocky Mountains, so far as it has hitherto been explored, there can scarcely admit of a doubt but the general strata of this central portion of the United States consists of rocks at least as recent as the Cretaceous period. The specimens of gold and silver ores which have reached us from these Territories, appear chiefly to consist of mixed sulphurets and oxyd of lead, copper, antimony, iron and silver, in all varieties of proportion; generally, also, containing gold and occasionally metallic silver. When composed only of oxyds and sulphides of copper, with silver and gold, the ores are susceptible of economic and successful treatment; when, however, the same are intermixed with galena and antimony, the extraction of the precious metals becomes much more difficult, and can only be profitably accomplished, with average ores, under the supervision of a thoroughly experienced metallurgist. A large part of the cupriferous ore containing the precious metals, not only of these districts, but also of North Carolina, would not be difficult to handle by an able expert.

Sodium Amalgam—Reply to Prof. Wurtz.

MESSEURS. EDITORS:—In your MINING AND SCIENTIFIC PRESS of September 29th, 1866, I find a paper on the "Utilization of Sodium in Gold and Silver Amalgamation," read by Prof. Wurtz before the American Association for the advancement of Science, at Buffalo, in which "some objections are considered," whereby Mr. Wurtz, with a sort of self-confidence, accuses me of errors, fallacies and non-concurrence in opinion with other Californians experienced in amalgamation.

Mr. Wurtz says: "Kustel has erred mainly in supposing that the purpose of the sodium amalgam was to decompose silver ores by extracting their sulphur by sheer force of chemical affinity."

This chemical action by which the sodium decomposes silver ores, is the only fact which can be proven as being effective in the treatment of such ores. Whenever sodium amalgam comes into contact with silver sulphides, chlorides, tellurides, etc., the sulphur chlorine, tellurium, which is set free, is found immediately combined with the sodium in the solution, and only an equivalent quantity of silver is amalgamated—no more. Is this no chemical action? What does it matter whether this chemical action is purely a chemical one, or whether it is combined with an action which "appears" to be in a manner electric, if there is no more silver reduced than what was freed by action of chemical affinity? What practical use can be derived from that point of view which Prof. Wurtz assumes? The "highly electro-positive condition of the quicksilver" is certainly a most interesting scientific topic; but the adoption of this theory does not change the practical result of using sodium amalgam on silver ores, of which only such combination can be reduced, perfectly, with a proportional quantity of sodium, as are free of antimony; but this equivalent quantity is just the obsta-

cle which prevents the application of sodium, for two reasons:

First. On account of its being too expensive. Second. Because it causes a greater loss in quicksilver, by rendering the latter liable to be ground to flour, (if used on silver ores rich in sulphurets, in the required proportion, in iron pans.)

As to the ineffectiveness of the sole electric condition of the quicksilver; that can be illustrated by the barrel-amalgamation with common quicksilver. Here the galvanic action is produced by the positive iron and the negative quicksilver, between which the dissolved salts of the roasted ore serve as a conductor. This galvanic current assists greatly in the amalgamation of the silver; but if half of this charge should be unroasted ore, the quicksilver, although in an electric condition, does not effect the sulphurets in the least. Only the roasted ore being amalgamated, after it is reduced to a metallic state by chemical action.

Mr. Wurtz says further: "Kustel's experiments having been based upon an incorrect idea of the mode of action, have but little applicability *pro* or *con*, and inconsistencies were pointed out in his conclusions."

I cannot understand how experiments can be made upon an "idea" of the mode of action, which (that is, the mode of action), must be found out by the experiment before the idea can be formed. The conclusions which I based on experiments* did prove to be entirely correct; even the remark that *no saving* of quicksilver can be expected by the use of sodium amalgam in treating silver ores. In regard to the "inconsistencies," in plural, Professor Wurtz says:

"Kustel's conclusions that iron pans cannot be used with sodium, for instance, is shown to be fallacious by very numerous working results now on record; in any case, it is fortunate that one negative result has little weight against concurrent, positive results of many others."

When I said that "silver ores cannot be worked with sodium in iron pans," I did not mean the physical "cannot," but the pecuniary. If some people do use sodium on silver ores, without minding the result, they of course establish the fact that sodium amalgam can be used in pans. A most simple experiment, however, is sufficient to show the difference between an iron pan and a wooden or stone arastra; take a small quantity of sodium amalgam in an iron ladle or spoon (not coated with tin), and the same quantity of a like sodium amalgam in a wooden or stone vessel—both under water; it will be found that the sodium in the ladle will be used up in less than *one minute*; whilst that in the other vessel will continue for *half an hour*, and longer. The ladle appears amalgamated. If in this case some pulverized silver ore should have been introduced, together with the sodium amalgam, which of the vessels would prove unsuitable—the iron one, consuming this sodium in the shortest time, or the stone vessel, where all the sodium is left to act upon the ore? The result and common sense will answer. Mr. Wurtz says: "the rapid and perfect collection and separation from a slime or pulp of contained and diffused silver amalgam, by the use of sodium amalgam, would alone give it an obvious importance." This may be so; but although silver amalgam is not silver ore, the rapid and perfect collection from slimes cannot be executed in pans; it must be done in wooden barrels with a formidable amount of quicksilver in which some sodium is dissolved.

As to the one negative result against many concurrent positive ones, Mr. Wurtz would be differently impressed if he should visit the mills in Nevada, where silver ores are treated. Our millmen try everything, and use whatever is found economically practicable, in spite of negative writing; but the use of sodium does not seem to be applicable to the silver ores of Nevada, although it is used to some extent for the amalgamation of gold in the quartz mills of California. Where the "very numerous working results" were obtained, Prof. Wurtz did not state.

G. KUSTEL, M. E.

* See MINING AND SCIENTIFIC PRESS, Nov. 18th, 1865.

ENCOURAGEMENT TO MINING LITERATURE.—The Valenciennes (French) Society of Agricultural Arts and Sciences has announced its intention of annually awarding gold, silver and bronze medals to the writers of the best papers on coal mines and mining. The medals are to bear the effigy of Sir Humphrey Davy, the inventor of the safety lamp. It would be a good plan for some of our New York societies to offer rewards for original papers pertaining to mining.

AN ODD FISH.—Victor Hugo describes the "Devil Fish" as a monster resembling an umbrella without a handle, with innumerable radii stretching out to grasp everything within reach, with no blood, no bones, no flesh, absorbing its victims into its pouch. The description is not less truthful than graphic.

(Written for the Mining and Scientific Press.)

Important Mineral Development near Virginia City.

EDITORS PRESS:—As many of your readers are, doubtless, interested in the development of this State, and more particularly those mines in the immediate vicinity of the Comstock, a few remarks on a somewhat remarkable ledge running about two miles east, and nearly parallel with this famous lode, may not be altogether unacceptable.

The lode in question commences, *i. e.*, exhibits well defined croppings, at its southern extremity, at the Occidental mine, situated about one and a half miles southeast of Virginia City, on the new Dayton road, and runs north-easterly nearly parallel with the Comstock, as far as the Monte Christo mine, a little to the north of the Gould & Curry mill, a distance of between two and three miles.

During the last three years it has been opened on and partially worked at various points with uniformly encouraging results—the most prominent mines being the Monte Christo, St. John and Occidental; but it is only since the thorough development of the latter, by the spirited and unaided exertions of Messrs. Weston & Co., that the great value of this deposit has begun to be appreciated by the public—a pretty general prejudice existing here against mines, the matrix of whose vein matter is anything but quartz.

The matrix of the lode in the Occidental is crystallized carbonate of lime, at the southern extremity of the claim (of 1,800 feet), terminating in white quartz at the northern end. This quartz continues northward through the St. George claim into the adjoining St. Patrick, where it begins to show evidence of carbonate of lime, which increases in quantity as we approach the next claim, the St. John, where it presents precisely the same crystalline appearance as we find in the southern part of the Occidental. This carbonate of lime continues with occasional streaks of quartz, about a mile and a half further north, till we reach the Monte Christo, and probably much farther.

The following analysis, made by me on the 2d January, 1866, on a poor specimen of this ore, will give an idea of its mineralogical character:

Gold.....	0.0016
Silver.....	0.0250
Peroxide of Iron.....	1.6370
Peroxide of Manganese.....	0.2500
Alumina.....	0.1750
Carb. Lime.....	83.7240
Sulphur.....	0.0050
Chlorine.....	Traces.
Silica.....	13.2500
Loss.....	0.3324
Total.....	100.0000

The inferences to be drawn from this is, that the silver exists chiefly in the form of sulphide, with a small proportion of chloride—the gold being in the native condition, invisible, from the very fine state of division in which it is disseminated through the mineralized portion of the ore.

The general appearance of the ore is very similar to that of Copiapo in Chile, (with which I am acquainted, from a five years' residence as a public assayer in that country), and from which most of the Chile silver is obtained. It was this remarkable similarity which induced me to advise my friend, Mr. Weston, to persevere in the development of his mine, some nine months ago, when most of his Nevada friends were endeavoring to dissuade him from a further prosecution of the undertaking, assuring him that silver could not possibly be found in paying or lasting quantities in any other matrix but quartz. The result has proved the correctness of my views up to the present time; *i. e.*, within twelve months upwards of \$180,000 worth of bullion has been taken out of this one mine, yielding at the mills an average of about twenty dollars per ton—the average value of the bullion being about \$1.90 per ounce—*i. e.*, as near as possible the quality of that obtained from the Comstock ore.

In all probability the average yield will be much larger next year, as the ore appears to increase in richness as well as in quantity, as greater depth is reached. This is shown by the following assays made within the last few

weeks, on samples taken from the most recent workings:

Gold.....	\$ 5.02
Silver.....	50.27
	\$55.29 per ton.
Gold.....	\$12.54
Silver.....	78.54
	\$91.08 per ton.

Against those made in February last, viz.:

Gold.....	\$ 7.52
Silver.....	26.70
	\$34.22 per ton.
Gold.....	\$ 5.02
Silver.....	25.12
	\$30.22 per ton.

The lode itself varies from eight to fourteen feet in thickness, and carries pay ore from one foot to ten feet in width. This pay ore is distinguished from the barren portions of the vein by minute spots of black sulphide of silver with arborescent black oxyd of manganese, which latter is beautifully developed on the milk-white compact quartz at the northern extremity of the mine, in the form of ferns, similar, but more distinct, to those found in the casing of some portions of the Comstock lode.

The lode dips to the east at an angle of about 40°, and has well defined walls of a hard schistose-like altered porphyry, the rock consisting of that formation, of a greenish gray color, and much harder than the bluish variety found in the Comstock. The result is that although the mine has attained a depth of 350 feet, having been worked down from the croppings, no timbering has yet been required; and the dip corresponds very closely with the slope of the mountain, the mine can be worked by means of short tunnels to a depth of over a thousand feet, thereby avoiding the very heavy expense of hoisting and pumping works.

From the brilliant success which has attended the experiment of opening out the Occidental mine, it is to be hoped that other claims on this magnificent ledge, particularly the St. John and Monte Christo, will soon be put into vigorous operation, when we may expect this ledge will prove one of the richest and most enduring in the State, outside the Comstock.

W. T. RICKARD,
Fellow of the Chemical Society and late Member of the Council of the Geological Association of London.

Virginia, Nev., Sept. 19th.

[Written for the Mining and Scientific Press.]

From Sierra County.

BY AN INDEPENDENT CONTRIBUTOR.

[Continued from page 146.]

EDITORS MINING AND SCIENTIFIC PRESS:—The vein of the Sierra Buttes Copper company is traceable on its line of strike for about one mile by croppings and workings, and broken fragments strewn the side hills and beds of ravines through which it courses. The vein proper, as shown by workings, is twenty feet in width, carrying about six feet on the underlie of nearly pure pyritous copper with associate ores, while its upper portion is, to a considerable extent, metalliferous, and by stamp work and a good concentration, would afford a large percentage of ore of a high grade and good character.

From several assays made by Mr. R. A. Cochrane, of the massive pyritous ore near the foot wall on the surface, an average of 27½ per cent. copper, and forty-nine per cent. gold per ton, was obtained. With the depth, the ore increases in richness, and will average fifty per cent. The larger portion of the vein, fourteen feet, carries a bluish antimonial ore, from which, by assay, ten per cent. of copper was obtained, and \$147 in gold per ton. The gold, however, does not appear to be free, and ordinary amalgamation could be hardly expected to save it. The lode, which is of quartz, courses through a narrow belt of feldspathic granite east, 10° N., cutting through syenite, and entering a hornblende trap on the west, where all traces of it disappears.

An adit level is being driven from a ravine which courses with the vein, and is now a 100 feet, giving a hack of about forty feet. When it shall have reached the center of the ridge, a distance of about 1,000 feet, it will give a back of not far from 300 feet. The vein is found dipping to the northward at an angle of 42°; its underlie shows a well defined clay seam on foot wall, considerable water flowing from the vein.

The ravine from which the level is started affords a sufficiency of water for milling purposes for any desired number of stamps. The surrounding country is heavily timbered. A good wagon road can be built to the Henness Pass road at an inconsiderable expense. The ores, however, should be smelted on the ground, or reduced to a regulus before freighting, as

every requisite is at hand in abundance, and they are of that class (containing no refractory minerals), that a common blacksmith forgo is sufficient to reduce them to pure copper, which I have seen repeatedly done by the workmen at the mine.

Other veins lie parallel and adjacent; but as the one described is a type of the rest, they do not require a further description. I should have observed that the sulphuret of molybdenum and its ochre, is one of the associate ores of the vein. This rare mineral occurs in almost every vein that I have seen in this formation, which belongs to and is made up of igneous rock, having been apparently poured out from the interior of the earth from a series of fissures extending in a northerly and southerly direction for more than 600 miles, forming the main summit of the Sierra range. Since that time internal convulsions have occasioned other fissures at right angles with the formation, which have become filled by metalliferous veins, and known as true or fissure veins. This class of veins have been proven by mining experience to extend downward indefinitely. As regard their linear extent, however, they vary. As a whole they are much more reliable than the segregated cupriferous deposits occurring in the schistose formations. These often produce large amounts of ore, and are very productive for a time; but all mining history has proven that the mining interests have been most prosperous where the true fissure veins exist, and are the object of research.

Letter from Colorado Territory.

EDITORS MINING AND SCIENTIFIC PRESS:—Enclosed please find a small fragment of meteoric iron. It is from a large mass discovered near Mount Vernon, Colorado Territory, some months since, by Mr. J. L. Willson and R. G. Morrison. The mass is of an irregular flat oblong form, and will probably weigh some 700 to 800 pounds. It is coated quite thickly with oxyds, indicating that it has lain a long time by its present bed. When it fell, it lodged on a bare, solid ledge of gneiss, and by the concussion, one end of the mass was considerably shattered, and at the time of our visit to it, we were enabled to obtain several very good specimens, one of which weighs eleven pounds. The mass is composed principally of iron, nickel and cobalt, with a little copper and magnesia. The ingredients however, are not evenly distributed through the whole mass, as in some parts the iron and nickel are in about equal proportions, with a little cobalt—in other parts the iron is in great excess, and in still other portions the nickel and cobalt are the principal elements. I would like to send you a larger piece for your cabinet, but cannot very well do so by mail, and it is too far and too expensive to send by the overland express.

I also send you a bit of moss agate—small, for the above reason—but a fair sample of the average quality found here. They are found in the greatest abundance in some portions of Colorado, and many very fine gems are also found among them, some as fine as any found in any part of the world—the stone being in many cases perfectly clear and transparent, with the "moss" clearly defined, and in beautiful forms. Some of the stones have a slight pink tinge; others are a milky white and very clearly translucent. The moss is generally black, like the specimen enclosed, but is sometimes found brown and yellow, green and even white. The latter color, however, is generally very coarse and irregular, possessing not much beauty or value.

Associated with, or very near these moss agates, we find many specimens of fortification agate, onyx, chalcedony, jaspers of various colors, and occasionally very good specimens of blood-stones or heliotrope, are met with. The agates are principally found in fragments scattered over the surface of the ground, but I have in two instances found them in place.

Beside these we find here many fine amethysts, some of them very large, beautifully colored, and very brilliant. Milk opals, too, are quite plenty; but I never have observed

the noble opal, though it is said to exist in the southwestern portion of the Territory. Tourmaline, amethyst, precious garnets, rock crystal, false topaz, aventurine, etc., are frequently met with.

THE MINING BUSINESS OF THE TERRITORY

Generally, is on the increase. There are now more stamp mills running than at any previous time since '62, and they are generally doing well. There are also three Keith desulphurizing furnaces running, with very good success. Lyon's smelting works are running regularly, too; and judging from the fact that they are buying all the galena ores that they can get, at \$50 per ton for such as will dress 75 per cent. galena, they must be doing very well. There are, besides, several smelting establishments in operation and in process of erection at the Georgetown and Snake River mines. Some of these mines are very rich in silver, with but very little gold. One specimen of argentiferous galena, sent to me, yielded by fire assay 3½ per cent. silver. It was represented as coming from a four and one-half foot crevice, with fifteen inches of solid galena of the same quality as the sample sent. I have also seen a few samples of ruby silver from the same mine. The gangue is largely composed of heavy spar, or sulphate of barite. Gulch mining, too, is quite lively in some parts of the Territory. Some old, abandoned claims, that would not pay two years since, have been worked with very good profits this year. This is partly due to a decline in the price of labor, and partly to the abundance of water that our late spring snows and unusually heavy rains have afforded.

Our rainy season is now about over, but we had a snow storm last night, and some ten inches of heavy snow fell, a very unusual occurrence for this country, at this season of the year. It probably will all be gone within twenty-four hours, and we look for six or eight weeks of fine weather before our winter sets in, in earnest.

THE AGRICULTURAL INTERESTS OF THE TERRITORY

Have been highly favored the past season. The late snows and early rains have rendered irrigation unnecessary. The grasshoppers, that have been the bane of Colorado farmers the three past years, have not visited us this year, and everything, (if we except some damage to spring wheat from smut), has been in the farmer's favor, and we have now as fine crops of almost all kinds (except fruits) as any country can boast of, and if we had the trees, we doubtless should have a good yield of fruit. These luxuries will come after a while. In the meantime we must depend on "America" for what little fruit we need.

The first annual exhibition of the Colorado Agricultural Society, is to be held at Denver, on the 20th, 21st and 22d of this month. We expect a good turnout and a "good show."

Yours very truly, J. ALLEN SMITH.

Spanish Bar, Col. Ter., Sept. 10, 1866.

[Written for the Mining and Scientific Press.]

The Meadow Lake Mines.

EDITORS PRESS:—Three years have elapsed since auriferous quartz was accidentally discovered in this district, by Hartley and his companion, who were then engaged in the occupation of trappers. But being recent arrivals from the Eastern States, and perhaps knowing nothing of the nature of the rock that lay beneath their feet, they might have pursued their calling to this day, and the world have remained in ignorance of our mineral wealth, had not the sparkling surface revealed the scattered treasures. It is scarcely a year and a half, however, since the stream of population to Idaho and Montana was partly diverted from its course, and emigrants from California and Nevada began to pour into this new *El Dorado*.

In the promiscuous crowd that usually flock to every new excitement, by far the greater number have no fixed plan of action—are stirred by every breeze, and animated by one sole purpose—the desire of realizing a speedy fortune. Under pressure of this unhealthy excitement, a large town has been built up nearly in a day, and money foolishly squandered in the purchase of lots at exorbitant rates, before the crust of the granite hills had been torn by the miner's blast. Partaking of this nervous sensibility and unsteadiness of purpose, which seem peculiar to the American people, hundreds, I might almost say thousands of ledge, (for the feet recorded and unrecorded number, I am credibly informed, over a hundred thousand,) have been located, many of which remain in the same condition in which nature left them. Everything went on swimmingly for a time, caution was considered synonymous with

skepticism, and dreams of wealth gave false promise of ease and plenty.

In every fever there is a crisis, upon which hangs the death or convalescence of the patient. Meadow Lake has just passed that critical stage, but she is in so low a condition at present, that her death has been already reported by her enemies, and daily looked for, with trembling, by some of her too credulous friends. To account for this sudden decline, and to give a very brief but unvarnished statement of the mineral condition, so to speak, of this district, is the object of the following remarks:

The slow development of the mines, and consequent stagnation of business, may, with truth, be attributed to three obvious causes—the want of capital, the disappointed hopes of thousands of silly adventurers who failed to find mines of twenty dollar pieces already coined, and to the want of experience in working profitably gold-bearing sulphurets, which are the principal feature of our lodes.

GENERAL CHARACTER OF THE VEINS.

The general character of a large number of claims on the surface is an auriferous gossan, containing considerable quantities of white quartz. The lodes are well defined and generally very wide. They contain from ten to sixty dollars per ton of free gold, and resemble, in a remarkable degree, the celebrated Banker mine in Placer county. In a majority of cases, after having reached the depth of from eighteen to forty feet, the iron pyrites seem to constitute the entire fissure, or at least seventy per cent. of the lode.

In every instance where a shaft has been sunk to any considerable depth (and some of them exceed fifty or sixty feet), the sulphurets have increased in richness in a corresponding degree; in fact, some of them have yielded from \$100 to \$1,500 per ton.

The free gold, which is visible in the top rock, contains a silicious coating that prevents a ready amalgamation by the ordinary process of copper plates, etc., which, necessarily, involves the general introduction of grinding and amalgamating pans. Again, the principal objection to the pan process is, that it makes foul amalgam, or the amalgam of iron and copper with mercury. This objection, I may remark, has been overcome by practical and scientific millmen.

Much has been written about the base metals and the difficulty of getting rid of them; but in my opinion, manganese and arsenic, which exist here in vast quantities, are the chief barriers to the development of the mineral resources of Meadow Lake.

After a careful examination of the district, and a number of experiments, I have come to the conclusion that the most practical method of working this rock is to roast the concentrated sulphurets in an ordinary reverberatory furnace, and amalgamate them by the steam-pan process, the total cost of which would not exceed \$7.50 per ton.

In regard to the erection of reverberatory furnaces, and the introduction of the chlorination process, it is proper to observe that the reason why they are not constantly employed is the lack of tables in the mills for concentrating the sulphurets. The cost of transportation is likewise an item to be taken into consideration. The insufficient supply of materials necessarily occasions a greater cost to mining companies, and makes them despair of realizing a dividend from their mines. In a few months, however, these deficiencies will be supplied, confidence restored, business built up on a steady basis, and systematic mining pursued here, as it is in less favorable localities.

In this communication, Mr. Editor, I have endeavored to give a concise sketch of the present condition of the mines of Meadow Lake district; for, in writing to a journal like the MINING AND SCIENTIFIC PRESS, one should ever bear in mind the truth of the apothegm, "Brevity is the soul of wit." But one word more, and I have done.

An impression has gone abroad that not only are the mines of Meadow Lake a humbug, but that the winter is so long and so severe as to preclude the possibility of working the quartz during that season. It is true that the snow averaged eleven or twelve feet in depth the middle of last spring; but to any one who is at all familiar with the localities in which quartz mining is prosecuted, and the obstacles that have been overcome to accomplish that end, will be satisfied, from a careful examination of the topography of this region, that not a tenth part of the difficulties exist here. Some preparation is, of course, necessary, and until that shall be done, we must not look for the regular prosecution of mining enterprises in this locality.

J. S. L.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, October 6th, 1866.

The course of the Money Market since the last steamer day has exhibited no material change, but we think there is a tendency to greater ease in some quarters. Applications for discount in Bank have been less pressing than formerly, and first-class mercantile paper is readily negotiable at current rates of interest—1@1¼ % cent. per month—more doing at the former than at the latter figure. In the open market the usual difficulties have been experienced in obtaining facilities, except upon prime collaterals.

Our latest advices from the East, on the 4th instant, quote Gold in New York at 147 $\frac{3}{4}$, with a great scarcity in the market, and commanding $\frac{3}{8}$ th 3 cent. per day. Sterlig Exchange is quoted at 108.

Sight Drafts on the Eastern cities, payable in coin, are made at $2\frac{1}{4}$ per cent., Currency Bills at 40 per cent. premium on Gold, and Telegraphic Transfers at 4 per cent. Sterling is quotable at 49d. for 60 days' bills.

Gold Bars are quoted at 840, and a moderate demand is anticipated for steamer purposes. Silver Bars sell at $1\frac{1}{4}$ ¢ discount for average lots.

Some \$30,000 in Legal Tender Notes have been sold during the week at $71\frac{1}{4}$ @71c.; at the close we quote them at $71\frac{1}{2}$ c. \$5,000 U. S. 7-3-10 June Bonds sold at 76c.

City Stocks continue inactive, and few transactions have been made during the week. California Steam Navigation Company sold at 72 $\frac{3}{4}$ cent. early in the week, receded to 71 $\frac{3}{4}$ cent., seller 30, then advanced to 72 $\frac{1}{2}$ $\frac{3}{4}$ cent., and at the close we quote it at 71 $\frac{1}{2}$ bid. Some \$500 of San Francisco Bonds, 6's of 1855, sold at 72 $\frac{3}{4}$ cent. Fireman's Fund Insurance Company have declared a quarterly dividend of 4 $\frac{1}{2}$ $\frac{3}{4}$ cent. on their capital, payable on and after October 4th. We quote this stock at \$11.20 per share of \$10. Spring Valley Water Works sold at \$59.50 per share, and at the close is quoted at same figure. This company declared their usual dividend of $\frac{1}{2}$ $\frac{3}{4}$ cent. per month, payable 10th instant. The Union Insurance Company have declared a dividend of 6 $\frac{3}{4}$ cent. for the quarter ending October 1st, payable on the 10th instant.

Six 3 cent. Bonds of the Central Pacific Railroad Company, to the amount of \$7,336,000, have been placed in the market in the city of New York. They are offered at 95 3/4 cent., with accrued interest, in currency. These bonds are secured by first mortgage, are to run thirty years, with interest payable semi-annually in gold.

The Mining Share Market has been somewhat firmer during the week under review than for some time past, and stocks have fluctuated little from previous quotations, the general tendency being towards an improvement. The aggregate yield of various claims on the Comstock lode for the month of September, embracing the Hale & Norcross, Savage, Yellow Jacket, Gould & Curry, Crown Point, Chollar-Potosi, Imperial, and Empire Mill and Mining Company, amounted to some \$1,050,000. As compared with the bullion receipts for the month of August from the same source, we find a small gain.

Hale & Norcross still remains in firm hands, and no sales were effected in the Board during the past week. We quote it at \$1,675 hid. During the month of September 3,130¾ tons of ore were reduced, yielding \$150,719.49, which is 65 ⅔ cent. of the assay value. From this very flattering result we may infer that the mine is in a very good condition.

Savage has improved since our last report, opening at \$1,100, s 3, steadily advancing to \$1,150, h 30, then selling at \$1,145, and closing

at \$1,141. The production of ore, it is said, has been greater during the week ending September 29th, without any particular effort, than for some time previous. A drift of 30 feet on the southeast face of the 6th station shows fair ore, and a rise of 35 feet above the track floor made from this point exhibits a good quality of ore. The south breast in the Curtis shaft will, it is thought, produce about 30 tons of ore per day during the first week of October. Besides supplying their own mills to their full capacity, sufficient ore, of the third grade, has been furnished for four outside mills. The amount of ore extracted during the week ending Sept. 29th, was 1,072 tons, and 1,107 tons were shipped to mills for reduction. The approximate value of the 1,072 tons of ore mined amounts to \$38,860, expenses of mining and milling the same, \$24,524, leaving a profit of \$14,336. This gives an average yield of over \$36 per ton. During the month of September the receipts of hullion amounted to about \$145,000.

Crown Point has not exhibited any activity for some time past, selling at \$910, s 30, during the week, and closing at \$925, bid. This inclines and lower drifts of this mine look well, we are informed, and the water in the lower level, at the latest date, had not become troublesome. During the week ending Sept. 29th, 10 tons of first-class and 550 tons of second-class ore were raised from the mine. This company, during the month of September, reduced 20 tons of first-class and 2,500 tons of second-class ore, and the yield of bullion for the same period amounted to \$115,000.

Chollar-Potosi advanced from opening quotations—\$113—to \$130, receded to \$105, rallied to \$118.53, and closed at \$116. No new developments have yet been made in the north and south drifts, on the 2d station, which are respectively advanced to 97 and 395 feet. Shipments of ore to Custom Mills for the week ending Sept. 29th, amounted to 472 tons. The receipts of bullion for the month of Sept. aggregate about \$75,000.

Gould & Curry continues inactive, and few sales are at present made in the Board. We quote it at the close at \$600 asked. This company have received, during the month of September, the sum of \$17,821.35 in bullion, and have mined in the same period some 6,000 tons of ore, 4,000 tons of which were reduced.

Imperial has set with more than usual sales, some 200 shares changing hands during the week, opening at \$85.50, buyer 30, receding to \$82.50, then advancing to \$87, and closing yesterday at \$83. The mines of this company continue in a favorable condition, with nothing special in regard to new developments. During the week ending September 29th, about \$37,000 in bullion were received, and for the month the yield amounts to about \$78,000.

Yellow Jacket has improved during the week, opening at \$695, advancing to \$770, h 30, then selling at \$729@735, and closing yesterday at \$742½. We may mention the continued favorable condition of this mine, without being able, at this early date, to give any reliable figures in regard to the receipts and operations for the month of September.

Opbir has receded from closing quotations of last week, opening at \$205, s 3, dropping to \$190, s 3, and closing yesterday at \$191, s 30. We have nothing of special interest to report from this mine. The Opbir-Mexican shaft has now attained a depth of 40 feet.

Empire Mill and Mining Co. is dull in the market, a few shares changing hands during the week at \$72½@70. At the close it is quoted at \$75 asked.

Belcher opened at \$95, s 3, advanced to \$103, s 15, and at the close we quote it at \$103, s 3. Confidence has materially improved on previous quotations, opening at \$53, advancing to \$61, and closing at \$58 bid.

Overman opened at \$18, advanced to \$21, then sold at \$18.50, and closed yesterday at \$18.50. Sierra Nevada changed hands at \$2.50@2, s 3, and closed at \$2.50. On the 2d of October an assessment of \$2.50 per share was levied on this stock. Daney sold at \$5, and Exchequer at \$1.50, seller 3. Bullion ruled at \$15@12.50.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday, amounted to \$322,557.50.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County—

From the *Miner* of Sept. 29th: The Mower tunnel, which has for some time been running in hard rock, struck into a softer material this week, supposed to be the casing of the ledge. Two shifts now keep the work moving night and day. Though they are running nearly on the course of this ledge, it is thought they will strike it within a few weeks. The Winchester Company have a proposition before them for the purchase of 1,000 tons of the ore from their 400-foot ledge—the parties purchasing to take it out. If the bargain is closed and we presume it will be soon, work will be commenced next week, and the ore got out ready for hauling.

From the Silver Mountain *Bulletin* of same date: The Washington Mill is rapidly approaching completion, and the workmen are only awaiting the friction gearing that is to drive the "barrels," which are expected in a few days, when soon after all will be in motion. The tunnel in Buckeye No. 2, in its progress to the north is nearing the second chimney. We saw ore from it on Monday, that is richer than any from the first. The ledge in the Balacava is improving in character, as the tunnel penetrates the mountain, and assuming a more solid formation. Mylett & Carmichael, finished their contract of seventy-five feet of tunnel for the Lady Elgin Company, having been twenty and one-half days in running the same. We learn that nearly, if not quite, seventy-feet more of tunnel will be required to cut the ledge. The bullion taken out of the I X L claim last year, amounted to over \$13,000, although only a trifle over \$6,000 is given in the annual report of the Secretary. There have been some important alterations made in the "By-Laws" of the Company, which the newly elected trustees feel confident will inure greatly to the benefit of stockholders in the future.

Amador County—

From the *Ledger*, Sept. 29th: The owners of the old Moore quartz ledge, at Scottsville, have resumed work on their claim. When they suspended operations, more than a year ago, the rock paid as high as \$10 per ton. The past week has been exceedingly dull; nothing of importance has transpired in this section.

Calaveras County—

From the *Courier*, Sept. 29th: We notice that the Keystone Company have commenced work on the western end of their claim, near the old caved-in shaft. Several river claims at Jenny Lind have recently been opened. Mr. Irvin, of San Andreas, has put up an engine on one to pump the water, on which he is working a party of Chinamen on shares. It is said to be yielding a large dividend. A Company at Spring Valley pumped out an old shaft about one hundred feet in depth, and commenced sinking. On the second day they struck rich dirt. They cleaned up forty ounces from their sluices last week, and the dirt appears to be getting better as they advance.

From the *Register*: The Fair Play Company are crushing rock with an arrastra, which pays a good dividend. They have an extensive lead, and large amount of excellent rock. We are informed that an offer of \$30,000 has been made for the claim by San Francisco capitalists.

Colusa County—

From the *Sun*, Sept. 22d: A shipment of twelve hundred pounds of sulphur was made from our landing last week. The company expect soon, to begin the regular shipment of it by the ton. They had had luck with their condenser some time ago.

El Dorado County—

From the Placerville *Record* of 26th: Quartz mining in this county, from present appearances, has received quite an impetus. The Harman Mill and Mine within our city limits, is in constant motion, with a full supply of rock which yields handsomely. The old Poverty Point, promises to be a profitable investment. The old Pacific, also within the city limits, that has yielded its thousands of dollars per run, is being put in proper shape for profitable working. The Eagle mine, at Grizzly Flat, has proved rich. We are informed by reliable parties from this section (not interested in the mine) that the rock has averaged \$25 per ton. At Georgetown, Coloma, Soap Wead, Johnson's Canou, and many other localities in this county, ledges well defined and rich have been discovered, and a few of them partially opened. There are still many sections of this county unprospected which, in the opinion of competent judges, are equally as rich as those already mentioned. Hydraulic mining is not carried on very extensively in this section, owing mainly to the high rates of water and necessary heavy expense in fitting

up; but the few that are being worked are yielding rich returns to their owners. There is a valuable claim now being worked at Cold Springs, about five miles from town, owned by Messrs. Schullmerich, Goodnow & Co., four in number. These gentlemen have labored incessantly for four years in opening their claim, and have expended for this purpose upward of \$20,000.

Humboldt County—

From the *Times* of Sept. 22d: The Humboldt Oil Company proposes to sell shares at the par value of five dollars each, sufficient to raise a sum of money—say \$3,000—that will authorize the commencement of boring for oil. Thereafter the balance of the stock will be sold at the same price. No debts are to be contracted by the association in any event. No assessments whatever are to be levied at any time. The payment of five dollars per share exonerates the purchaser from any liability thereafter.

Kern County—

From the Havilah *Courier*, Sept. 29th: We have been shown several fine specimens of gold bearing quartz, found in the Greenhorn district. These specimens were taken from the Lilly, Lewis and Examiner lodes. From the Lilly and Lewis veins the gold is visible throughout the quartz and it is extremely rich. From these specimens the lodes will probably pay six or eight hundred dollars to the ton. They are working with arrastras. The Examiner lode, recently discovered by Bob Stewart, will pay from \$70 to \$80 per ton. The Rich Bar (placer) mines, twenty miles from Havilah, on Kern river, are owned by Reed & Thompson, Ward, Fontaine & Avants. There are ten men employed, and the dirt now pays about \$20 per day to the man. Last week worked out in four days over \$700. The cost, before they commenced taking out gold, was \$2,500. Gilbert & Co., are working their claim, which pays well. Mr. J. W. Sprague, of the mining firm of Muncton, Sprague & Amshury, has negotiated in Boston a sale of five lodes in Mt. Sinai, or Kelseo district, for the sum of \$50,000 in legal tender notes. Mr. Sprague is now on his way out. The McKeedney mill commenced running again, on Monday last, after a long silence.

A 10-stamp mill is to be put up by the Pettus Company, in place of the old 4-ball crusher which proved such a complete failure. The Olancha Company have the machinery of an 8-stamp mill on the ground. The Grant shaft is over 105 feet, showing a ledge eight feet thick. The North shaft, 60 feet, ledge 2½ feet, with rock rich in free gold. On the Yreka, shaft is down 70 feet, ledge one foot thick, with very rich rock. On the Antelope, shaft 60 feet, stopped on account of water. A tunnel is now being run to strike the ledge at a depth of 100 feet. Vein four feet thick.

Mariposa County—

From the *Gazette*, Sept. 29th: Bear Valley is looking up, and considerable life is noticeable in the town. The Pine Tree and Josephine mines are paying well and additional hands are being added.

Nevada County—

From the *Gazette* of 27th Sept.: Wm. L. Tisdale presented us yesterday a fine specimen of sulphuretted ore, taken from the bottom of the incline of the Banner mine. Assays and working tests prove it to be rich. A suit was commenced on Wednesday, by Horace Beach against the Eureka, for an undivided seven-sixteenths of two hundred and seventy feet of the mine. The ground claimed adjoins the original claim of Ercot & Co., and includes the best part of the claim of the present company.

Same of 29th: The new hoisting works at the California mine were started up on the 27th, and worked to a charm. The engine is the most powerful one in the county. A 10-stamp mill will be erected without delay. A 5-stamp mill is on the way to the Grizzly ledge, at Devil's Cañon.

Same of Oct. 3d: The Eagle company have recommenced operations on their ledge. We saw yesterday some fine specimens of good looking quartz, taken from a ledge discovered a week or two ago, about two miles east of Nevada, near the Red Dog road. The locators have already sunk a shaft to the depth of fifty feet, and the ledge has increased in width from about two feet on the surface to four or five feet at the bottom of the shaft. It is owned by Richard Dillon and others. At the Fox copper mine, Greenhorn, the shaft is down 80 feet. They may have out between fifty and sixty tons of ore, which it is estimated will average between twenty and thirty per cent. copper, and fifteen or twenty tons of this will be shipped to San Francisco this week.

From the *National*: The owners of the Ophir mine took out \$2,000 in specimens on Tuesday morning. One piece of quartz which weighed 31 ounces, contained 22 ounces in gold. We were shown yesterday some very fair rock taken from the Great Central Ledge, Walker and Bayless Company, a short distance below Forrest Springs. The ledge was struck

at a distance of forty feet from the surface and is twelve feet wide. The Lucky mill, 15-stamps, started up on the 1st Oct. The tunnel in the Jim ledge is now 450 feet long, and cuts the ledges at right angles. Two crushings have been had from rock taken from different portions of the ledge, both of which yielded within a few cents of \$30.

EXCELSIOR.—From the *Sun* of 25th Sept: The Reduction Works Company have effected a loan at Nevada City, and there is now a certainty that the mill will be completed and working before the 1st Nov. A few days since, \$2.50 were panned out of two pounds and six ounces of rock taken from the tunnel of the Dutch Flat Co. Twenty tons of ore from the Alhambra ledge, recently worked at the Winton mill, yielded upward of \$260.

Same of 27th: The Comet Co., has sunk thirty-five feet with its shaft, finding the lode at that depth to be some twelve feet wide. An assay of rock taken from the bottom of this shaft, shows \$624.23 in gold, \$46.30 in silver, and 15 per cent of copper.

Placer County—

From the *Herald*, September 29th: Mr. Matthewson, of the Martinez Quartz company, has sent us several pieces of rock from their claim, that shows splendidly in free gold.

The *Stars and Stripes* gives a list of the quartz and cement mills in the county, with the number of stamps in each. There are eleven cement mills, with an aggregate of 150 stamps. Of quartz mills, there are nine with a total of fifty stamps, and two others, one of forty and the other of ten stamps, nearly completed. The 40-stamp mill is to work the Banker mine.

The editor of the Dutch Flat *Enquirer* had visited Gold Run. He says: "Entirely independent of 'outside capital,' and indifferent what opinion 'capitalists' may form as to the reliability of their ground, or its desirability for investment, the Gold Runners have closed their most successful year's mining, and are energetically at work preparing for another season. As it is now an established fact that the lower and untouched is richer and more extensive than that which has been for some years so successfully worked, they make their calculations with reference to operations many years ahead with as much confidence as most miners do for the same number of days in advance. Montana, Idaho, or any other distant gold fields stand but a poor show for having their population increased by Gold Run miners."

Sacramento County—

From the *Folsom Telegraph* of September 29th: Palmer & Day's Quartz mill, on the Jersey Blue ledge, is crushing about ten tons per day of selected rock. As they have not cleaned up we cannot give the result, but it is reported very rich.

Shasta County—

From the *Courier* of September 29th: The Kellinger company have run the lead out on both sides of the tunnel, and find themselves confronted by a solid and seamless wall of granite. Twenty-five thousand dollars have been expended on this claim, and no ledge yet. Last week the Potosi company run twelve tons of rock through their mill and the average yield was sixty dollars per ton. Middletown bids fair to regain some of its former importance. The Tornado company are working two hydraulics. Since the Tornado has gone to work, some thirty claims have been taken up on the same lead, and will be worked as soon as water can be obtained. Prospects in South Fork district are good. In the Chicago lode is wide, regular, and well defined. The Big Central has a shaft down over thirty feet, shows a ledge over four feet wide, and rock taken out during the past week prospects immensely rich in gold.

Sierra County—

From the *Messenger* of 29th September: The Montpelier company are building a new flume head dam on the east fork of the North Fork. The Sierra Buttes mine will clean up in a few days about \$40,000. The Sierra Tunnel, at Gold Cañon, is again paying dividends to the shareholders. An apparently valuable lode has recently been struck in Ladies' Cañon. New discoveries are daily reported. The Oro Quartz Company have commenced sending ores to the Montpelier mill. They are driving ahead their adit level. The Good Hope company is quarrying very rich ores for milling at the Gold Bluff mills. The company are negotiating for a mill, to be put up early in the spring. A rich quartz ledge, called the Mammoth, was recently discovered in Sailor Ravine, about three miles north of town. The croppings show free gold. A conditional sale has been made of the discovery for \$12,000. The Ohio company have out about three hundred tons of rock ready for crushing. A quantity of this ore was sent to San Francisco and worked at the North Beach mill, and paid handsomely. The Independence company, at the Sierra Buttes, cleaned up this week a bar of \$17,000. This was for a run of thirty days. The main level is being rapidly driven ahead to one of

the richest chimneys of the vein, which it will soon reach.

Siskiyou County—

The *Yreka Journal* of Sept. 27th, says: The quartz mining interests of Siskiyou appears to be growing brighter every week. The leading section, at present, is Humbug, at which place all the ledges are prospecting handsomely. During the past week a number of San Francisco stockholders in the Siskiyou lead have been visiting their claim, with a view to putting up a mill, and work is progressing steadily on the Shasta-Butte lead in getting out rock to be crushed next month. The Lash & Co. ledge is also being worked constantly.

Tulare County—

The Buena Vista claim is producing from 2,500 to 3,000 gallons per month of superior oil.

Tulame County—

From the Columbia *Citizen*, Sept. 29th: In a side drift, recently run in the Mariposa claim, a vein has been found apparently independent from the original lead, which prospects from fifty to seven hundred and fifty dollars to the ton. This new vein is about twenty feet from the old lead, and is pitching in the same direction. The Hazel Dell mine, about 400 feet from the Morse, has a shaft down 100 feet, from which they are drifting. The only lot of ore yet crushed yielded \$25.25 per ton. They have a 5-stamp mill.

It is reported that the Harris claim is conditionally sold to the Raw Hide Ranch Co., for \$20,000. Some of the top rock has been crushed with a yield of \$18 per ton. The Preston claim has been disposed of to General Rosecrans.

NEVADA.

Washoe—

From the Gold Hill *News* of Sept. 29th: The new shaft of the Imperial and Empire companies, being sunk jointly by the two companies in the ravine coming down from Virginia, has now attained a depth of 580 feet, and the work of sinking the Ophir-Mexican shaft 100 feet deeper is being actively prosecuted with a full force of hands night and day.

Reese River—

From the *Reveille*: There were received to-day, Sept. 24th, 4,750 ounces of crude bullion from the Cortez district. The bullion was reduced at the mill of the Mount Tenabo company. A certificate of assay was shown to us this morning, (25th) which gives the yield of \$1,129.45 of silver to the ton. The ore was obtained from the surface in the Reveille district. The new mill of the New England and Nevada company, Smoky Valley, started on the 24th, with ten stamps. The working of the machinery was perfect, and afforded entire satisfaction.

The "Indian Jim" ledge, Hot Creek, crosses the cañon at a right angle and rises up the steep perpendicular hills on either side to the height of nearly 2,000 feet. It has been traced four miles to the northward and about one mile to the southward. The course is north and south, with a dip of sixty degrees to the east. The face of the vein exposed is about 600 feet long and 60 feet wide, presenting a massive wall of mineral, which varies in thickness from thirty to sixty feet. The situation affords the greatest facilities for the most systematic and extensive operations in mining. According to the best authority, the Indian Jim is a true fissure vein. So vast are its dimensions that we are informed that several millmen who examined the ledge at the point of greatest exposure, estimated the quantity of ore above the surface to be nearly 400,000 tons, the major portion of which, in their judgment, would pay for reduction.

From Cortez district, we hear almost daily, the most encouraging news. Several companies are at work on their mines with the most satisfactory results, and are taking out the best quality of ore, which will shortly be brought here for reduction. The Taylor & Passmore have extracted ore, one ton of which has been carefully assayed, and which they are confident will yield \$500. From the McAleer mine, five tons have been taken out, which are estimated to exceed \$200 per ton. William Gill has taken from the Gill mine, located at the northern end of the "Giant," two and a half tons of mineral, which he avers will go \$250 per ton. The Mount Tenabo Company is working the Cortez Giant, a location on the "Giant," with the highest success. It has sunk on the claim to the depth of thirty feet, disclosing a vein of compact ore seven feet thick, which will yield at the rate of \$150 per ton. This has been traced for 300 feet. The 13-stamp mill of the company is reducing at present about seven tons daily, but it is thought the amount may be increased three tons.

Esmeralda—

The Union of 29th says: G. W. Coffee has added a new battery of four stamps to his little mill in the lower part of town, and keeps it constantly at work crushing rock for customers.

Humboldt—

From the *Register* Sept. 29th: The Gem is

driving ahead in earnest, and will next week have twenty men at work. . . . A few days since, samples from two localities on the Ophir vein were shipped, and a test was made at the Pioneer mill. The result was a yield of \$40.32 to the ton, all silver. The vein is from two to three feet wide, and the ore tested was taken from wall to wall without any selection. . . . The Pioneer mill is running on Manitowoc ore this week. . . . The Munroe sent a small bar of gold bullion, value \$1,000, by last express. **Black Rock.**

Below we give the results of the working of the rock from Haidin and High Rock districts; these results were obtained at Dall's mill in Washoe Valley:

HARDIN DISTRICT.	
Monadnock Lode (surface).....	\$256 00
Snow Storm Lode, 40 feet down.....	174 71
Derrima Lode, (surface).....	48 84
Ruby Lode, (surface).....	105 69
Banner Lode, (10 feet down).....	147 00
Eureka Lode, (20 feet down).....	51 00
Summer Series Lode (surface).....	40 00
HIGH ROCK DISTRICT.	
Blue Lead, (surface).....	\$113 00
High Rock, (surface).....	96 00
Bonham, (surface).....	95 00

These results were all obtained by mill process, and leave no doubt of the richness of the Black Rock region.—*Sage Brush, Sept. 1st.*

IDAHO.

From the *Avalanche* Sept. 22d: The "Oro Fino and Morning Star Mining Company," has been organized, with a capital stock of \$250,000. Creditors of Moore & Fogus, representing that amount, constitute the company. . . . The Richmond ledge is looking better. The Cosmos mill is to be kept in operation throughout the winter. . . . E. L. Johnson, not Zenas Wheeler, is one of the proprietors of the mill for Flint district. . . . Judge Lowe, of Iowa, has been making a personal inspection of the mines in Owyhee district, with a view of investing therein. He has decided to erect two 10-stamp mills in Flint district as early in the spring as machinery can be freighted there; also, to tunnel War Eagle Mountain, commencing at a point near Miner's mill.

Flint district correspondence of the same says: A new era has dawned upon Flint. The first long wished for and much spoken of quartz mill is on the ground. A part of the machinery of Burnham, Johnson & Co.'s mill is also on the ground, and ere spring opens, two mills will be in working order. The latter mill is about to be erected on the Fogus site, at the junction between the towns of Oro and Owyhee. The workmen on the Rising Star have for the present abandoned sinking on the ledge, but will soon commence work again. The Sherman company have commenced a tunnel at the level of the gulch, and intend striking the ledge at a depth of about 100 feet. An Iowa company have bought the Forrest Discovery claims and intend erecting two mills here in the spring.

Idaho City correspondence: "Doctor Bryant and others of this place, have started a tunnel into East Hill, commencing on the Bear Run side. They are now in about 140 feet, and a day or two since they got through the bed-rock and have struck into a kind of clay, mixed with gravel and quartz, which prospects first rate. Wm. Middleton has been into it from the start, and a day or two since Vantine & Co bought in. The contract is to run in the tunnel 300 feet. In Placerville their tunnel has created quite an excitement and they are running them in all directions. If this country is going to pay better under the bed-rock than it did on top of it, there is a chance for it to be a great one yet. One thing I know, I prospected the huck end of the tunnel from the top to the bottom, and if there is plenty of such ground as that, I can pack the dirt out in a bucket and wash it in a rocker and make ten dollars a day, and not work very hard either."

From the *Statesman* of 13th Sept.: Benson's mill, on the Wide West, at Rocky Bar, will be started again this fall.

Ruby City correspondence of *Shasta Courier* says: A new ledge was discovered last Saturday, which equals anything yet found in this district; native silver is being taken out of it by the pound almost, and a wild excitement prevails in consequence. Claims are staked off in every direction.

The failure of Moore & Fogus has cast a gloom over this community, but I think it will prove salutary in the end, as it will result in the establishment of a healthier financial condition. Heretofore orders on Moore & Fogus have been the principal currency, but since their failure gold and silver is beginning to circulate.

MONTANA.

From the *Post* of the 15th: In Bivin's gulch, two hundred miners are engaged in working upon the old claims, and make, on the average, more than regular wages. There are no Chinamen interested in this section, and the present laborers do not intend that there shall be as long as it continues to pay so well. . . . The news from Highland gulch is very encouraging. Nearly 500 men are prospecting, and many of

them have been very successful. The dust is, of course, and many nuggets have been picked up, although none of them are of great value, the largest being worth \$40. The diggings are shallow, and it is only five or eight feet from the surface to the bed rock. The miners have not been disturbed by winter. We have been told that a descendant of Ham, who owns desirable ground, has refused \$5,000 for it. There is quite a stampede for this gulch, and its merits will be clearly known within a few days.

Bannack correspondence says: "The shaft on the Huron, in Blue Wing district, is now forty-five feet deep. The mineral looks well. * * It appears there will be quite a camp at the new diggings on Lemhi. Quite a number are mining there, and the dust that is brought into Bannack for goods is as fine as our own."

We hear a rumor of rich diggings somewhere, more wonderful than McEllan or Alder gulches, said to be about seventy miles from Bannack. Messrs. Smith & Graeter own the "Pioneer Water Ditch Company," and obtain a supply for their hydraulics from Horse-Prairie creek. They have been taking out upon the average, \$500 per week, and have recently struck dirt which will pay better.

Same paper has an editorial in regard to a letter which has been going the rounds under the head of "Montana's Bilk." It says: "If Alder gulch is 'played out,' we desire to state that there are claims in it which are producing \$3,000 or more every week. Messrs. Campbell and Schumann, of Diamond City, took with them to Fort Benton, \$200,000, in forty sacks of \$5,000 each, the profits of one season in Confederate gulch. In the same train there were \$200,000 more which belong to a few individuals. We have been informed by reliable parties that the steamerboat Luella which recently sailed down the Missouri river, conveyed over one million in gold dust, most of which belonged to miners alone. This extraordinary event has not been noticed as it should have been. If an ocean steamer should bring from Europe ten thousand dollars in coin, the incident would form the subject of a leader in every American journal. But when the wealth is taken from the bosom of the earth and poured into the national resources, it does not make an item for the press. Six workmen in McEllan gulch realized \$70,000 apiece, and left for America about two months since."

COLORADO.

From the *Denver News* of Sept. 12th: We have specimens from the Hotie Jane and Yosemite lodes, situated north of the Arkansas river, near Red Mountain district. These specimens, by a free gold assay—crushing and panning—yield eight ounces to the ton. Ten tons of the ore make a cord. The assayer thinks that an assay of the pyrites, contained in the ore, will increase the yield to twenty ounces per ton. . . . Times are improving in the Snake River mining region. A private letter from there says: Things are brightening here much since I last wrote; everybody is building and the miners are pretty well satisfied with the new mining law. . . . Capt. Holson is just in from the Peru district, Snake River mines. He has discovered and secured title to four lodes with well defined veins of argentiferous galena, from three to eleven feet in width, and which assays from \$50 to \$300 to the ton, in silver.

The editor has paid a visit to the Snake River mines. He says: Immediately around and above Peru—which is almost at the upper verge of timber growth—there are from fifty to one hundred known and well defined leads to which a team and wagon can be driven. From twenty-five to sixty men have been at work for the last two or three months. Next season reduction works will doubtless be established. On the South Fork, five miles from Peru, Hon. John T. Lynch has already erected a furnace for smelting ores. Since our return we learn that one or two runs have been made with the most flattering success. Peru is sixty-three miles from Denver.

From same of Sept. 9th: Cyrus Hurd starts to-day for Black Hawk, with a 20-stamp mill, which is to be set up immediately. . . . It is a long time since as many mills were running as now. No one works without at least paying expenses. More gold is being taken out than usual, and while at present we have dull times there is a promise for better things in future.

From the *Journal* of the 18th: J. E. Lyon & Co., yesterday shipped 200 pounds of mat, worth about a \$1,000 a ton in currency, one-third the value being copper. That will quite pay the cost of transporting to New York and separating, leaving the bullion net profit. . . . Mr. Darby, for the Perigo Company, is having a few cords of ore taken out by him last winter, tried at the Griffin mill, and the indications are most encouraging. . . . Mr. Brown has got in with a 1,000 pounds of ore from Red Mountain. It looks well, and is to be thoroughly tested. It came from a ledge the croppings of which are 13½ feet wide. . . . The Georgetown

Smelting Company are building a large reverberatory furnace precisely like those at the Lyon Smelting Works at Georgetown. Many parties are going to get out ore in Argentine and Griffin to be tested at the new furnace as soon as it is ready. Before winter we shall know something more definite and satisfactory of our silver resources. . . . Things are swimming in Ward district. Improvements are being made and projected. The Niwot mill continues to pay as at first. . . . Mr. Fitzpatrick cleaned up yesterday and retorted \$365½ ounces of gold.

GEOLOGICAL INVESTIGATION DESIRABLE.

We have frequently felt both interested and instructed by articles relating to mining and mining matters, which have appeared from time to time in the columns of many of our mining exchanges. Two articles of this description in the *Amador Ledger* have recently attracted our attention, under the titles, respectively, of "Quartz and Placer Mines," and "Quartz Ranges." The former article gives a comprehensive geographical description of the various placers, barren grounds, and ground containing quartz lodes, found in Amador, Calaveras and El Dorado counties; showing the particular relation which each bears to the other. The editor of the *Ledger* remarks that, so far as his observations have extended in the above counties, there are three distinct and well-defined ranges or belts of gold-bearing rocks lying between the summit of the Sierras and the foothills, running nearly parallel to the axis of the mountains, with intervening ranges of barren territory. Experience has taught both the quartz and placer miner to confine his labor principally to the region embraced within the gold-bearing ranges. A disregard of these facts has cost the unintelligent millions of dollars, and the problem yet remains a stumbling block to the inexperienced. Experience has demonstrated that the value of a quartz mining district should generally be pretty closely gauged by the former value of such a district for its placer mines. In the article on "Quartz Ranges," allusion is made to Prof. Rowlandson, and other writers whose contributions have appeared from time to time in the *Mining and Scientific Press*, desiring their assistance in elucidating some of the more difficult problems and theories, in relation to our gold-bearing regions, which require demonstration. In order to second the wishes of our cotemporary, we clipped the two articles above alluded to and enclosed them to Professor R., from whom we have received the following in reply:

POTRERO NUEVO, Oct. 3d, 1866.

EDITORS MINING AND SCIENTIFIC PRESS:—I duly received your note enclosing slips from the *Amador Ledger*. Some of the points alluded to by the editor of the *Ledger*, it was and still is my intention to embrace and endeavor to elucidate in a concluding chapter respecting "The Age of Gold Bearing Rocks." Others of great economic importance, which will have some day to receive a legislative settlement, would require separate treatises of great length; I allude to such as the one ledge theory. I cannot conclude the note without calling the attention of the *Amador Ledger*, yourself and all others interested in promoting the future progress of mining, to the very unsatisfactory nomenclature adopted in the mountains, for describing objects relating to mining and geology.

For instance, the editor of the *Ledger* describes certain ledges as "Boulder Ledges." What does the expression mean or imply? I suspect, but do not feel certain, that I know what is meant. Another matter is alluded to as "a variety of rock known amongst miners under the name of lava," under which term I presume travertine or tufa is meant. A phenomena, however, of a still more interesting character is described as distinguishing the upper or eastern range or belt, "the great distinguishing feature of which is its immense dyke of limestone, cutting through every intervening obstacle, and flowing down along the mountain side to the southwest, like some great river." Phenomena not greatly dissimilar, but on a very much smaller scale, I have observed, though very rarely, amongst the carboniferous rocks of the British Isles. It is not impossible that fused limestone may have flowed in the manner described, however impossible the circumstance may appear to ordinary minds. Such appearances, however, so rarely present themselves that the fact as asserted should be carefully examined before the same is accepted as proved. Perhaps the

editor of the *Ledger* would oblige his readers with additional particulars.

THOMAS ROWLANDSON.

Our columns will always be open, and every facility given, to advance the interests of mining and of the parties engaged therein. A mere desultory discussion, whether in our own, or any other columns, would probably prove more voluminous than interesting or instructive. Much of the correspondence would probably consist of a reiteration of similar facts by different parties. We think the object sought by our esteemed cotemporary of Jackson, would be more easily attained if an arrangement could be made, by those more particularly interested in mining throughout the great central mining regions of California, say in Nevada, Placer, El Dorado, Calaveras, Amador, and Tuolumne counties, etc., to organize local clubs in their respective districts, which should engage some competent person, say, for instance, Professor Rowlandson, to make a careful examination of the mineral regions, collect all the local information readily attainable, and then deliver a series of lectures descriptive and illustrative of the same, before the several local clubs; detailing the special phenomena, if any, which may be observed in the various localities, and giving such economic and practical hints as may be thought serviceable. A vast amount of valuable practical information might thus be collected and disseminated, which could not fail to exert a most important and happy influence on the general advancement of mining operations throughout the State. We merely throw out the above hints, that our mountain friends may think of them and judge of their feasibility and utility.

We have quite a number of intelligent practical men, in this city and State, who are abundantly able to make themselves useful in the way we have pointed out, and whose services might be secured for a moderate compensation. We have spoken especially of Professor R. in this connection, for the reason that his correspondence with this paper has both shown him to be a gentleman in every way qualified for such a field of usefulness, and has brought his name so prominently before the mining public as to induce our *Amador* cotemporary to make especial allusion to him. In other countries, such things are carried out under government auspices. In our own country, the lack of practical information with regard to mining matters, among government officers and advisers, leads rather to taxation than governmental encouragement of mining operations—a policy which time will eventually show to be most disastrous to one of the great leading sources of our country's prosperity, whether in war or peace. In connection with this matter, it may be well to remark that the publication of a skeleton map, on a large scale, of the chief mining districts, such as is alluded to in our "Notices to Correspondents," in the present number, would greatly aid the views above set forth.

The following suggestion, in regard to the meteoric shower announced for the 13th or 14th of November, has been made in one of our city journals:

"That in every city the City Fathers appoint a special watchman, whose business it shall be, on the first appearance of the phenomena, to ring the fire-alarm bells, to awaken the inhabitants; as there cannot be a doubt that every one will be anxious to see the grand illumination."

We think the idea a good one.

To FILTER caustic potash and caustic soda, take an ordinary funnel, put in fragments of marble, and then coarse grains, covering with fine powder; wash out until the water runs through clear, and the filter is ready for use. The caustic lyes run through this filter very rapidly. The funnel must be kept covered during the operation. When it is desired to free the carbonates of the alkalis from all traces of chlorine, add carbonate of silver and filter.

SCANDINAVIAN INDUSTRIAL EXHIBITION.—Sweden, Norway, Denmark and Finland have combined to make an industrial exhibition at Stockholm of their products of art and industry. The exhibition building is said to be a fine structure.

Canvassing Agents.

Our Agents can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. Thomas Starr is Agent for the MINING AND SCIENTIFIC PRESS in Nevada, and will canvass the principal cities, towns and districts of that State. August 25, 1886.

Mr. O. F. Truesdell will act as our Corresponding Agent and Solicitor in the interior of this State, from this date. August 25, 1886.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.

SAN FRANCISCO, Jan 11th, 1886.

San Francisco:

Saturday Morning, Oct. 6, 1886.

NOTICES TO CORRESPONDENTS.

Owing to the great and rapidly increasing amount of our correspondence, consisting largely of queries relating to various interesting points connected with Mining and Metallurgy, we find it indispensably necessary, for want of space, to confine our replies in future chiefly to a series of brief notices, which hereafter will appear regularly under the above caption.

Q., REESE RIVER.—We are quite familiar with the variety of ore submitted to us, which is so prettily marked with blue and green spots. You err, however, in common with most of those who have described such ores, in calling them chlorides and bromides. The blue and green spots are carbonates of copper; chlorides may be present. The latter, in a pure state, present the color and general appearance of horn; hence its vulgar term, "horn-silver." The bromide of silver is very rare, and when found it is usually associated with the chloride. Both can be extracted from any ore containing them by means of heated concentrated ammonia (spirits of hartshorn). If the solution so obtained is subsequently saturated with muriatic acid, and a few drops of the latter in excess be used to precipitate the silver as a chloride, the latter will be obtained as a curdy sediment. The value of the ore in silver may be estimated by weighing, after carefully drying the precipitate. Every 100 grains of the latter contains 75 of pure silver; or, if estimated by vulgar fractions, every grain will contain three-quarters of a grain of silver. Should, however, the ore contain silver in the form of sulphide, this would have to be looked for in another manner.

A LEARNER, NEVADA CITY.—You are right; a skeleton map of the various mineral veins of this State ought to have formed the first publication of the State Survey. A very useful and instructive map of this character, illustrating the course, dip and angle of the chief gold and copper veins, together with the dip or contorted character of the enclosing rocks, all of which could have been explained by means of well known geological characters, is a great desideratum. Such a map, even on a scale of one inch to a mile, of the chief mining sections, might have been completed three years ago. Had it been so, others, willing like yourself to assist in filling up the details, would have been greatly aided. Such a work would not be very expensive, and the State would long since have been amply compensated by the great assistance it would have been to the numerous independent observers, whose accumulated labors would have brought forward a mass of information, far greater in extent and value, than it is physically possible for the limited staff, officially engaged in this work, to accumulate in a long term of years.

A SUFFERER.—We are afraid that if we devoted the entire space of the MINING AND SCIENTIFIC PRESS to an attempt at exposing the malpractices, sharp practices and frauds of mining speculators, we could do little either to assist those who have been, or prevent others from being similarly imposed upon. Such glaring deceptions as have been effected by the introduction of wild-cat schemes, could scarcely have been successfully carried out, had it not been that during the late, like all other exciting periods, the gullibility of the public was in the highest possible state of tension; much of which, however, may perhaps be largely attributable to individual cupidity, aroused to intensity by the glowing descriptions of smart operators. Had all the capital paid to prospectors and others for stock in crude and undeveloped claims been applied, in an economical manner, to opening out the respective properties, both individuals and the community would have been largely benefited; fewer undertakings (pure wild-cat excepted) would have collapsed; more dividends would have been paid, and fewer assessments called for. Much extravagance, no doubt, attended the earlier operations, not only in mere working, but also in inordinate salaries to presidents, superintendents, etc. We suspect, however, that far less distress has been occasioned by willful management, with the object of operating on the share market, than is commonly supposed. In this respect ignorance, rather than willfulness, has exercised the chief influence in prejudicing the interests of stockholders.

THE COLLEGE OF CALIFORNIA.

One of the first duties of every community is to provide for the education of its youth. A majority of our State Governments have wisely made provisions to secure for the Common School a liberal and permanent support from the public funds; but the higher institutions for learning are left more to the care of the people in their individual capacity. The first goes hand in hand with the pioneers of civilization; the latter should be made to press closely upon the advancing line of the former. The School will most signally fail in the accomplishment of its mission, if it is not closely followed by the College, to which, in these modern days, we must mainly look for those who are to fill, not only our pulpits and forums, but also the leading positions in all our chief industrial pursuits. Time was when the industrial world plodded along, year after year, and century after century, in the same old track that had been trodden for thousands of years before; while the paths of learning were but little sought after except by those who were willing to bury themselves from the world in the barrenness of monastic study. But in the present age of physical and social progress, no people can hold their own, much less maintain a position in advance of neighboring nations, who fail to carefully prepare a goodly number of their young men for the great intellectual conflicts which now give life and form to the material as well as to the literary status of the civilized world.

The now altered conditions of the expected duties and responsibilities of educated men, from what they were a century or so ago, require a corresponding change in the mode of imparting instruction, and, in the surroundings from which the student should derive his early scholastic impressions. The seclusion required in former times, must now give place to a suitable degree of association with active life. To be qualified as leaders in the broad field of modern civilization, young men, during their term of study, should, by association, attain an intelligent appreciation of, and sympathy with, the true spirit of the age, by a proper familiarity with its higher and more characteristic forms, as developed in a model neighborhood life.

The founders of the College of California appear to have fully considered these important preliminaries in selecting a site for that which seems destined to become the leading and model institution of learning on the Pacific Coast. They have been most fortunate in making a selection, around which must soon grow up a community just fitted to form the neighborhood and surroundings of a literary institution of the class proposed, and which is now well under way in Oakland, but which will soon be removed to the spot selected for its permanent home. Months of patient and diligent search, in every direction, within a moderate distance of San Francisco, were expended ere the present site was fully determined upon. Years of subsequent reflection, and the universal voice of hundreds of men well versed in such matters, and from all parts of the world, who have visited and carefully examined the site, have fully approved the choice. Indeed, the most casual observer, who is at all acquainted with the usually forbidding aspect of the country around this city, has only to visit the spot selected to at once see the wisdom of the choice.

Situated at a convenient distance from the city, in full sight thereof and of its shipping, and directly opposite the famous Golden Gate, with a broad foreground, embracing hill, dell and plain, rock, tree and shrub, water, land and island views, with some of the finest mountain scenery of the Coast Range in the distance, and a constant succession of the most gorgeous and varied cloud views, which any land or climate can produce, there seems nothing left in the way of natural prospects which heart can wish. With regard to climate, it is as peculiar, unique and desirable as is its scenery. We have already said it was directly in front of the Golden Gate. Its distance therefrom is

about fifteen miles. It is well known that through that remarkable break in the Coast Range there is almost every morning, for one-half of the year, a constant flow of cold air, which, mingling with the warm, moist atmosphere that rests over the city and neighboring interior water and land, condensing its moisture into the shape of cold, heavy fogs, which are so much dreaded by our citizens; while the other half of the year, a still colder and more violent wind comes rushing in through that same shore mountain pass, chilling everything with its rough blast, and almost blinding the eyes with the clouds of dust which is everywhere raised in its course. It is this cold, dry northwest wind, absorbing every particle of moisture which it can reach, from plant, flower and soil, that renders the scenery immediately about San Francisco such a dreary, barren waste.

By looking at a map of this immediate coast, it will be seen that the narrow strip of water which enters from the ocean, soon opens into a wide expanse, and divides to the north and south. The land, on all sides from this water generally rises quite abruptly to a considerable height. With the map still before you, and reflecting that under the conditions named, the chief force of the winds will pass along the water courses, as their lowest, smoothest and most direct channel, it will naturally occur, that before they have time to expand over the interior, they must fork or divide at a point about seven or eight miles inward from the Golden Gate, one branch moving along northward toward the Bay of San Pablo, and the other moving southward, along the larger bay, toward San Jose. Now this is just what they do, after passing Alcatraz Island. Almost the entire force of the lower current of air is found following the water channels; very little of it being perceived in Oakland, or on any part of the Contra Costa coast, for six or eight miles northward. No matter how heavy the wind comes rushing through the Golden Gate and over the city of San Francisco, let a boat start from Alcatraz, where the force of the wind is at its height, and move eastward in a direct line with the wind, as observed at that point, it will soon be in comparatively calm water. After reaching the land in that direction, let the observer continue his course straight forward to the foot of the Coast Range, some five miles further, and he will still find himself in a calm atmosphere. Passing on still further, to near the top of the Coast Range, just back of the college grounds, and at an elevation of nearly a thousand feet above the sea, he will then again strike the current of air from the ocean, which has come in at an elevation too high to be affected by the topography of the ground which we have described, and, therefore, continues on in its direct course until it dies out and mingles with the great atmospheric ocean; precisely as a mountain torrent debouching suddenly into a body of still water, gradually loses its impetus and mingles with the surrounding fluid. The air below may be compared to the still water in the bottom of a large mill pond; while the force of the current urges forward the surface-water to the brink of the dam, that portion near the bottom remains at almost perfect rest, with merely sufficient disturbance to make such a gradual change of its volume as shall suffice to preserve its purity. In the case of our atmospheric current, the Coast Range of mountains serves the purpose of the dam, aiding the other causes to which we have referred, in producing the atmospheric quiet in this remarkable locality.

After carefully considering the above, the reader will have no difficulty in divining the cause of the peculiar isolated climatic condition of the locality which has been selected for the college site. Indications are abundant in the nature and appearance of the soil, which shows that this spot, as well as quite an extensive strip of territory along the foothills, was once covered with a luxuriant growth of arborescent vegetation, which might readily be renewed with a little care. The ancient timber growth still continues along the line of the river, where it has been protected from the rav-

ages of fire; and some small experiments seem to prove that with a very little care, trees, even such as require a large excess of moisture, may be made to flourish upon the greater portion of this tract without the aid of artificial irrigation, except at the start.

One of the peculiar features of this locality, is a deep gorge which penetrates to quite a distance from the foot of the mountain, furnishing numerous springs, which, uniting near its mouth, pass out into the plain, forming a most picturesque and beautiful glen, filled with a heavy growth of forest evergreens, interspersed with a great variety of shrubbery, and in the spring decked with innumerable flowers.

Prof. Wood, the distinguished botanist, who recently visited the locality, pronounces it one of the most remarkable, and the richest in botanical productions, which he has met with throughout the whole coast, from Los Angeles to Oregon.

There is a tract of country here which comes under the influences above described, and which consists of eight or ten square miles, the center and key of which is the college site. This locality must soon be sought after by persons desirous of pleasant suburban residences, for such can be found here, possessing attractions unequalled by any locality even among the most delightful retreats of the Atlantic States. No where else in the wide world, that we are aware of, can such a desirably uniform climate be found, combining all the delightfulness of a temperate zone, without even a touch of its frigid winters, with the benedictions, the fruits and the flowers of the tropics, entirely divested of their malarious atmospheres, their burning suns and their scorching winds.

The time is not far distant when we shall have large numbers of wealthy families who will seek for just such retreats from the hustle of the city. There are even now those among us who are looking around for localities suited to family and neighborhood life, in accordance with the high scale of civilized society to which this city is fast approaching. Already we have quite a list from among those of our citizens standing highest in social position, who have signified their choice of this locality as their point of retreat, either immediately or after a few more years of continuance in the active duties of commercial life. Another year will witness the erection of quite a number of residences, to be soon thereupon followed by constantly increasing numbers. The College will soon follow, and its establishment there will generate around the new community a literary atmosphere, which added to the refinement of a select population, will impart fresh attractions to the hallowed and honored name of BERKELEY, which has been most appropriately applied to this pioneer seat of learning on the Pacific Coast. Those of our citizens who are thinking of providing for themselves a home outside of the city, where they can spend in quiet the declining years of life, or enjoy a more quiet present than the bustle of the city will permit, should by all means take a look at the place we have described.

EXPERIENCED MINE WORKERS.—We need in this country, and especially at the present time, more intelligent, experienced and honest working mine superintendents; men, who, from education, observation and practice, have a thorough knowledge of minerals, and the various modes of treatment to which they should be subjected, according to their peculiar characteristics. We want mine and mill superintendents, whose practical knowledge will enable them to avoid the expensive errors into which so many have been led from mere theoretical knowledge, or worse still an entire lack of any knowledge whatever of that which they have assumed to be able to direct. So much imposition has been practiced upon mine holders, by pretentious scientific superintendents, charging enormous salaries while living fat and leisurely, that men of real merit have come to be appreciated for less than they should be. There are thousands of mines in this State, the profits of which could be doubled by employing proper overseers; and doubtless the holders would seek such help, if they could have any assurance of securing good men, at reasonable rates. We believe an advertisement in our issue of to-day, furnishes the address of such a person.

SINGULAR EFFECTS OF CONCUSSION.

During the recent experiments made in New York, by Col. T. P. Shafter, by order of the Secretaries of War and Navy, two pieces of wrought iron shaft, each piece about five feet, long and twelve inches in diameter, were perforated with a bore fifteen inches deep and an inch in diameter, in one end of each. A plug was then fitted to screw tightly into the muzzle of each. One of these pieces was charged with nitro-glycerine, and fired through a vent-hole in the plug. The plug was forced from the orifice. The second was also charged with nitro-glycerine; but tamped with loose earth. On being fired, the piece was burst into three prongs, being thus split to the base of the drill-hole.

The most singular circumstance connected with this latter experiment, was the reported remarkable fact that the disrupted iron, when subsequently examined, was found to have been crystallized, and, to a considerable extent, restored to cast iron!

The bore of the first piece was then deepened to twenty inches, and charged with twelve ounces of nitro-glycerine, the aperture closed by a screw three inches deep and the charge fired. This piece was also burst, and the same appearances of crystallization appeared at the lines of disruption, as were noticed upon the one previously burst.

These phenomena of change in the structure of the iron, under the circumstances named, are certainly most remarkable, if all the facts have been reported, and correctly stated. The change in the structure of iron caused by long continued percussion is well known; but we have never before heard of a case where any perceptible modification has been effected by a single impact, either from explosives or from any other source. The case is so remarkable, that before giving full credence to the results claimed, we should desire to learn the history of the two pieces of wrought iron employed in the experiments. To what use had they been previously applied? Perhaps they might have been long used as steamboat shafts, or for driving by iron gearing, heavy machinery. If so, the constant and long continued percussion communicated by the paddle or heavy gearing might have gradually produced the change noticed, immediately after the nitro-glycerine experiment.

There are many other similar uses to which these two pieces of iron might have been put, that would have brought about the results alluded to, as it is intimated in the account before us, that they were pieces of a wrought iron shaft. Indeed the very hammering of the iron in the process of forging might have produced a sensible degree of crystallization. It is said that so much importance is attached to this phenomena that the broken fragments have been placed in the War Department at Washington, to serve as evidence of this new and remarkable scientific development. Would it not be well, before accepting, as real, the molecular change alluded to, to examine carefully the structure of the opposite and solid ends of the pieces of iron, if such examination has not already been made? This proposition is made on the assumption that the crystallization, which must have been instantaneous, could not have been continued through the entire mass. If it was not, the crystallizing effect of the explosion upon those parts which received the impact more direct, must be accepted at once.

Again, there seems to be a tendency in all such powerful explosives as nitro-glycerine, gun-cotton and fulminates of every description, to refuse to obey the general law of resistance, which requires a body to pass along the line of least resistance—for instance, in case of gases escaping from a crystallized body, they should find their exit along its planes of crystallization; in case of an uncrystalline structure, along the line of fibrous adhesion. It is well known that fulminating powder, when fired on an open thin iron plate, like a fire-shovel, for instance, instead of obeying the law of following the direction of least resistance, will often pass downward directly through the iron. Gun-cotton, when fired in front of a strong wall, will often find its way backward through that wall,

instead of expending its entire force forward and upward, as gunpowder would do under the same circumstances. Then may it not be that in the New York experiments, the terribly active power brought into action, completely ignored the molecular structure of its opposing walls, and instead of passing out between the lines of fibrous structure of the wrought iron as gunpowder would have done, completely ignored those lines of least resistance, and found its way out, on the same principle that electricity makes its way, zigzag, through the atmosphere, thus rendering the iron at the points of separation crystalline in appearance only? Have the fragments been subjected to an ordinary breakage, since the experiments, to ascertain whether the entire mass is crystalline? Experimenters have no right to assume anything. Possibly all our suppositions, and more, may have been considered and acted upon. We respectfully submit the above suggestions for what they are worth.

CONTRIBUTED FOR OUR CABINET.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, cristallites, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

J. ALDEN SMITH, of Spanish Bar, Colorado Territory, sends us an amethyst of exceedingly delicate tint, a piece of mass agate, and two specimens of what he conceives to be meteoric iron. These specimens are alluded to in a communication from Mr. Smith, which will be found in another column. We are inclined to think he is mistaken with regard to their being of meteoric origin. It is quite possible that the original mass may be a boulder of mineral. A mine yielding an ore quite similar to that before us—a sulphide of iron and nickel, was worked in 1851 upon the estate of the Duke of Argyll, in Scotland.

Since the above was in type, we have received the September number of *Silliman's Journal of Science*, in which we perceive two notices of what is evidently the same "meteorite," (?) from which the specimens above alluded to were taken; although the specimens there described do not seem to be identical in character with those in our possession. The color, an important item in connection with the identity of this mineral, is not given in that journal. The specimens forwarded us present a bronze yellow appearance, excepting the oxidized exterior, which is deep bronze, an ore, which we are assured, closely resembles, in external characters, the mineral which we have described above as found in Argyleshire. The characteristic features of meteoric iron, as described by Mr. Shephard in *Silliman's Journal*, are not visible in the specimens before us. In fact the two specimens sent to us do not present any metallic appearance; but merely that of mineralized metals, such as many of the sulphides, which leads us to infer that the broken pieces could not have been derived from a meteorite. If subsequent investigation establish the latter to be the fact, we can only say that it differs, in every external point, from any meteorite which we have either seen, or heard or read of.

THOMAS STARR, our traveling correspondent in Nevada, sends us some specimens of a very peculiar ore found in the lode described by our Virginia City correspondent, in the present issue. This ore is of a light brown color, and very much resembles in appearance a partially decomposed syenite; it really consists, however, of about 84 per cent. of lime, 14 per cent. of silica, with the balance of two per cent. made up of alumina, per oxyd of iron, oxyd of manganese, with traces of alumina, sulphur, chlorine, gold and silver. The character of the ore is very similar to that of the celebrated Copiapo silver mine of Chile. We believe it is the only mine yet discovered on the Pacific Coast, carrying a gangue of this character. It is a kind of ore that not one prospector in a hundred would think of looking at; yet it is doubtless very valuable. It is but little harder than decomposed copper gossan; hence it is very easily reduced under the stamp. Its silver is carried chiefly as a sulphide; its gold is free, but very fine. Miners will do well to read carefully the letter of Prof. Rickard, descriptive of this mine, which will be found in another column. Samples of the ore may be seen at this office.

LIST OF OFFICERS OF CORPORATIONS AND MINING COMPANIES.

[PUBLISHED IN THE FIRST ISSUE OF EACH MONTH.]

(Below we give the date of recent meetings held in this city, and the names of officers chosen or appointed. Every bona-fide company is invited to send us the result of their election, to be thus put on record, gratuitously, with any other facts of general interest.)

GEORGE WASHINGTON G. & S. M. Co.—Sept. 17th. Trustees: W. D. Root, J. H. Gilmore, A. G. Wood, T. B. Townsend, I. W. Clark. President, W. D. Root, Secretary, A. G. Wood; Gen. Superintendent, J. H. Gilmore.

INDEPENDENCE COAL M. Co.—Sept. 28th. Trustees: A. Bleck, Jos. Brandenstein, E. L. Gohstein. President, Wm. W. Greenhood, Secretary, W. Waterman; Treasurer, Jos. Newbauer; Superintendent, Robert Wingate.

SANTA CRUZ PETROLEUM OIL WORKS.—Oct. 2d. Trustees: Leander Ransom, E. Winship, Austin Walrath, N. C. Walton, J. Martenstein. President, Col. Leander Ransom; Vice President, E. Winship; Secretary, R. Wegener; Treasurer, Austin Walrath.

SEATON M. Co.—Sept. 12th. Trustees: Lloyd Feris, J. W. Gashwiler, C. J. Hutchinson, D. M. W. Seaton, Wm. Thompson. President, Lloyd Feris; Secretary, Joel F. Lightner; Superintendent, J. R. Robertson.

TELEURIUM G. & S. M. Co.—Aug. 27th. Trustees: T. W. Brennan, G. W. Ryder, G. S. Hall, W. H. Hyda, J. R. Maad. President, T. W. Brennan; Secretary, Wm. G. Ryder.

RECENT INCORPORATIONS.

BUILDERS' INS. Co.—Capital stock, \$50,000; 500 shares of \$100 each. Directors: A. Rosenfield, Thos. Mooney, Samuel Crim, Nathaniel Page, John Dunn, J. W. McCormick, W. G. Weir, Jas. D. Connell, W. A. Jank. Sept. 21.

LAFAYETTE PARK HOMESTEAD ASSOCIATION. Capital stock, \$14,000; 40 shares of \$350 per share. Trustees: Edwin Goodall, Geo. T. Vincent, John M. Todd, John W. Brumagim, J. L. Jones, Wm. Hellis, Edward Barry, John W. Nye, Henry Mahau. Sept. 10.

OAKLAND CENTRAL HOMESTEAD ASSOCIATION.—Capital stock, \$64,000; 80 shares of \$800 each. Trustees: Elijah Bigelow, T. B. Bigelow, William W. Crane. Sept. 1.

REAL ESTATE ASSOCIATES.—Capital stock, \$120,000 (with right to increase the same to 400,000); 200 shares of \$600 each. Trustees for the first three months: J. L. Jones, W. E. Wood, W. Hollis, E. Barry, L. S. Pease, H. H. Russell, J. A. Eaton, T. S. Russell, J. W. Jordan, H. K. Morse, G. R. Spinney. Sept. 28.

SAN MATEO WATER CO.—Capital stock, \$1,000,000; 10,000 shares of \$100. Trustees for the first three months: Wm. E. Barron, F. D. Atherton, Thos. H. Selby, Simon M. Mazes, Benj. G. Lathrop. Principal place of business, San Francisco. Sept. 27.

SAN FRANCISCO KAOLIN M. & MANUFACTURING CO. Capital stock, \$80,000; 800 shares of \$100 each. Trustees: A. J. Sayder, M. S. Whiting, Joseph Mosheimer. Principal place of business, San Francisco. Sept. 29.

SAN FRANCISCO FUEL CO.—Capital stock, \$100,000; 1,000 shares of \$100 each. Trustees: Samuel Tyler, Marshall Hastings, William Doolan, W. P. Dewey, Chas. M. Tyler. Principal place of business, San Francisco.

TRIO MINING CO.—Capital stock, \$500,000; 5,000 shares of \$100 each; Gen. W. S. Rosecrans, A. Hayward, Oscar L. Chamberlain. Sept. 28.

To Miners and Families Living in the Country.

Dr. Boynton's MEDICINE CHEST, is put up in San Francisco expressly for the use of families, and consists of a chest of moderate dimensions, neat in its appearance, containing those household articles, simple remedies, that families always feel like keeping on hand for immediate and common use, and a book of brief instructions, describing their use.

The object in preparing this Chest was not to make doctors, but for the simple purpose of nursing; hence, a majority of the remedies are such as are familiar to nearly all who are advanced in life, and the book is simply a representation of those plain truths relating to the department of the nurse already set forth in more extensive works. It was the object, not to say many things, but to say few things—to simplify and make plain for common use. And in selecting the contents of the Chest, the object was not to set forth something new and wonderful, but those of old and acknowledged worth.

In view of the above facts, physicians have everywhere encouraged the circulation of this chest in unmistakable terms. They recognize the fact that families do not, will not, need not call on them on the occasion of every slight derangement or infirmity. They do not and cannot deny the fact that such obligations of home care rest upon heads of families.

The book gives a description of nearly every medicine in the collection, their use, and their component parts, so that every person may know what he is receiving into his stomach or applying to his person. This openness and frankness is regarded by the best practitioners, and all considerate persons as justice, more than policy. The universal conviction of the more thoughtful is, that that which relates to our health and physical well-being in this life should, above all things, be known, and not kept in the darkness of secrecy.

In introducing this chest in the country, we always first submit it to the criticism of practicing physicians, and feeling the importance and seeing the necessity in this sparsely settled country of home-nursing, and seeing the adaptability of this chest, physicians in San Francisco, Sacramento, Stockton, Knight's Landing, Cacheville, Marysville, Colusa, Oroville, Lincoln, Folsom, and Auburn, have given it their hearty sanction. Seeing the necessity on this coast of people relying upon themselves in such matters, physicians in this State have remarked: "If I could choose but one for a family, I would every time choose the nurse instead of the physician." "If families would get a collection of simple remedies, with plain instructions for their use, they would do away with half the doctoring." "All families should possess themselves of a collection of common remedies, with plain instructions for their use." "I would like to see the chest in every family"—"it is a convenience"—"it is useful"—"much sickness and much expense might be saved by such home care."

We submit the following statistics from Sutter County, California:

"The undersigned have had Dr. Boynton's Medicine Chest in their families for the last few months, and willingly state that they regard it as a wise provision, strictly practical and highly useful."

Every person having the chest in the above named county has signed the above article. The publishing of the names being unnecessary, we withhold them and save space.

The undersigned have known Dr. Boynton's Medicine Chest for the last few months, and regard it as a wise provision, and highly useful in every family. The medicines being put up with instructions, its utility, convenience, and great economy are unquestionable.

Signed by Judge HURLBURT and 45 others.

STATE OF CALIFORNIA, } ss.
County of Sutter, }
I, C. E. Wilcox, County Clerk in and for said County, hereby certify that I am personally acquainted with a majority of the individuals whose names are subscribed to the foregoing certificates, and that they are good and substantial citizens of said County.

Witness my hand and official seal this 27th day of [L.S.] December, A. D. 1865.

C. E. WILCOX, County Clerk.

Agents wanted in every County to sell this Family Chest. The compensation will be a liberal commission on all sales. The Agent should be a resident of the district which he is to canvass, and accompany his application with good references, and of this city if possible.

We can give further particulars when desired.

All letters should be addressed through the post office, to

Quartz Mill Construction and Superintendence.

THE UNDERSIGNED IS AT PRESENT OPEN FOR AN engagement as a working Superintendent in the construction or operation of a Quartz Mill. He has had five years steady and successful experience in working ores in Wales, and is practiced in saving sulphurets and the treatment of rebellious ores. He is prepared to furnish references for all the necessary qualifications of an intelligent, faithful and reliable quartz operator. Address F. M. SHAW, San Francisco, care Mining and Scientific Press. 14x13-1m

A NEW BANDAGE FOR WOUNDS.—A private letter from Baden says that a Colonel now stationed in Baden has just drawn the attention of the Government to a new invention of French origin. "It is a kind of bandage for wounds with a solution of lime. Experiments have been made with this healing lime at Strasburg with great success. The principal advantages seem to be: 1. A saving of time, as four wounds may be dressed in the same time as one with the ordinary proceeding. 2. An accelerated process of healing, as no other bandages or plasters are required, and the air is completely kept out. Moreover, the expense is very small, and great cleanliness is possible; the patient can take care of himself, and the apparatus is so small that one surgeon can carry about him the necessary material for hundreds of patients. I suppose the medical papers will soon give detailed information to the profession. It seems that the inventor, whose name is Millot, has patented his invention, but at the same time has offered it to all the Governments—I suppose for a consideration."

DISCOVERY OF LITHOGRAPHIC STONE.—The *Flag* of this city, says: "We have in our possession a specimen of stone taken from a ledge in Mariposa county, that for home or lithographing purposes is pronounced equal to most of that imported from the East. The stone is of a grayish white color, hard as flint, of very fine grain and susceptible of a high polish. It has sufficient grit to render it an excellent substitute for the Michigan stones now in use. Mr. Eston, one of the discoverers of this substance, says that the ledge, so far as discovered, extends three miles in length by one in width; extensive enough, surely, to supply the world. They have named it the 'The American Flag.'"

Machinists and Foundries.

PALMER, KNOX & CO.,
Golden State Iron Works,
Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF
MACHINERY,
STEAM ENGINES AND QUARTZ MILLS
DUNBAR'S IMPROVED
Self-Adjusting Piston Packing,
Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.
WHEELER & RANDALL'S
NEW GRINDER AND AMALGAMATOR
HEPBURN & PETERSON'S
AMALGAMATOR AND SEPARATOR,
Tyler's Improved Water Wheel,
Giving the greatest power, at lower cost, than any wheel in use. There are over 1,500 running, giving universal satisfaction.
KNOX'S AMALGAMATORS,
WITH PALMER'S PATENT STEAM CHEST,
Superior for working either Gold or Silver Ores.
Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past eight years in quartz mining, and being conversant with all the improvements either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-1f

GLOBE
Foundry and Machine Shop,
STOCKTON, CAL.

KEEP, BLAKE & CO.,
MANUFACTURERS OF
Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers,
Mining and Irrigating Pumps, Car Wheels, Derrick Irons, House Fronts, Iron Fencing, Balcony Railings, etc., at San Francisco prices. Orders solicited and promptly executed. 13v13-1y

Pacific Forge Company.
FORGING AND IRON WORK.

THE PACIFIC FORGE COMPANY HAVE JUST RECEIVED, in this city, on Fourteenth street, near the machine shop of the San Jose Railroad, a large establishment for the purpose of forging and working in wrought iron. Our hammer is the largest upon this coast, and we are prepared to manufacture, at short notice, all kinds of heavy forgings, car axles, shafts, steamboat cranks, piston-rods, wagon axles, and other similar work. This is the first general shop of the kind erected in this State, and we solicit the patronage of the public. All orders executed at reasonable rates, and with promptness and satisfaction. 19v12-3m

Notice to Miners,
Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done. **M. PRAG,** 8v13-1y Stove Store, No. 125 Clay street, below Davis.

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic Hay, Bag, Screw and Drop Presses, Coining Machinery, Filo Drivers, Barks and Malt Mills, and all kinds of Castings.
ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.
BOILERS.—Locomotive, F.A.C. Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.
PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Wakle's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS,** of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.
H. J. BOOTH. GEO. W. PRESCOTT. IRVING M. SCOTT.

Brevities.

On the morning of Sept. 11th, the snow was eight inches deep in South Park, Colorado.

A coal area of more than 26,000 square miles exists in the northern and western part of Missouri.

From the beginning of the vintage of 1865, to the present time, seventy-five thousand gallons of grape brandy have been made in Los Angeles county.

One of the plans suggested for the tunnel under the English channel is, that of sinking an iron tube for the trains to pass through, the tube itself to be suspended by buoys in the channel.

A new material for paper has been patented by a New Jersey man. It is sedge grass, and grown upon tide flats. It is said to be an excellent substitute for cotton or linen rags. The paper made from it costs 20 per cent less than any other.

SOME American fishermen, while off the Farallones last Sunday, captured an enormous sun fish, which they found sleeping on the surface of the water. A tackle was rigged, and the monster hoisted on board. He was found to weigh 633½ pounds.

It is said that the portion of Illinois bounded by the Ohio river appears to be filled with lead veins thirty to fifty yards apart, and yielding ore in paying quantities. These veins begin about thirty feet below the surface, and have been traced down to the depth of 1,600 feet, becoming richer the deeper they descend.

AMERICAN VINE.—Ten years ago there was not more than three or four thousand acres planted with the vine in the United States, and now there are no less than two million acres so planted. Formerly American wine would scarcely bring one dollar per gallon, and now it sells at from two to six dollars per gallon.

A new product of the Butte county pine forests has made its appearance in the San Francisco market. It is an oil, which is distilled from the hackmatack. It is colorless, of an agreeable odor, and as light as camphene. It is used for cleaning silk and other delicate fabrics from grease, etc. It sells for two dollars per gallon. A Mr. Harrison is reported to distill 150 gallons per month.

An engineer in a mill in Philadelphia had been told that a steel spring might be effectively tempered if, while red hot, it were immersed in petroleum. He heated the steel and plunged it into a bucketfull of coal oil. The result was an explosion; and a conflagration was prevented only by the use of the donkey engine and hose.

Gold was discovered about a year since, near Lisbon, New Hampshire, by a gentleman who was making a tour to the White Mountains. He took specimens to Boston, had them assayed, found them rich, and formed a company of Hartford and Springfield merchants, which purchased the property in which the ore was found. The stock, worth a year ago \$5 a share, now sells for \$5,000. Some of the quartz is said to yield \$867 of gold, and \$150 of silver, per ton.

Rheumatism !! ANOTHER WITNESS!

SALMON FALLS, June 17, 1866.
H. BOWMAN—DEAR SIR: HAVING HAD A FAIR test of the virtues of RICHARDS' REMEDY for Rheumatism, I take great pleasure in stating that its effects with me have been even better than its recommendations claim. In 1863 I first heard of the Rheumatism of agents who have been severely afflicted with Rheumatism, and having tried everything I could hear of, without any permanent benefit, I concluded to try this also. On taking the medicine in three days I experienced great relief, and in one week was entirely free from pain, and had completely recovered the use of my limbs, which had become almost powerless. I have recommended RICHARDS' REMEDY to numerous friends, and in every case it has proved successful. I therefore take great pleasure in recommending it to all who are afflicted with Rheumatism, and especially to all mercurial chronic Rheumatism cases.
Yours respectfully,
ERASTUS PARSONS,
President of the Gen. Grant Mining Company.

RICHARDS' REMEDY is for sale by
H. BOWMAN,
Druggist, Sacramento. 1113
Price, \$2.50 per Bottle.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the procrastination of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of these agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press Patent Agency has strictly complied with the regulations of the Department, and properly filed all necessary papers as Claim Agents.

HAYWARD, COLEMAN & CO., IMPORTERS AND REFINERS —OF— Illuminating, Lubricating, —AND— PAINT OILS!

CONSISTING OF
KEROSENE, LARD, SPERM, ELEPHANT, POLAR,
TANNERS', NEATFOOT, BOILED AND RAW
LINSEED, CASTOR AND CHINA NUT.

—ALSO,—

NOTE.—We would specially call the attention of Mill owners and Engineers to our superior PARAFFINE OIL, which we manufacture from the California Petroleum. This oil will not gum Machinery, thoroughly cleaned and lubricated with it will not heat, and after remaining at rest, can be started without cleaning off.
A sample can of our Paraffine Oil will be forwarded on application to us, as we desire a fair and impartial trial.

Lamps and Lamp Stock!
An elegant and complete assortment on hand. 413-3m 414 Front street, San Francisco.

THE CALIFORNIA Aerated or Unfermented BREAD COMPANY.

Bakery on Folsom Street,
Between Tenth and Eleventh.....SAN FRANCISCO

MESSRS TAGGART, BULKLEY & DUFF, HAVING ASSOCIATED themselves in partnership, are happy in announcing to the public that they are now prepared, and would respectfully solicit all orders for their truly wholesome and cleanly Bread. We have a sufficient number of delivery wagons, at our bakery to guarantee to all who may favor us with their patronage a prompt delivery of fresh bread daily, Sundays excepted.

Through the kindness of the gentlemen of the following named firms, we are privileged to keep an order box for the entry of all orders for the bakery so that they may reach our earliest attention:
Order box at C. J. Hawley & Co.'s Grocery, corner Second and Jessie streets; Rowland & Walker 647 Clay street; Plum's Carpet Store, Montgomery street, opposite Lick House; G. W. Clark, Paper Hanging, corner Sansome and Clay streets. Orders handed to any of the route-men likewise. We expect soon to be prepared to supply Pastry. Hence the Boston Brown Bread, and Beans of the first quality. Due notice will be given.
The present Company is entirely independent of the former California Cereals and Bread Company, neither of them having been in any way connected with that company.

We would cordially invite the public to make a visit to our new bakery.
413-3m S. R. BULKLEY, Business Partner.

Mission Dolores,
Office, 629 Washington street, San Francisco. 2112-1m

EUROPEAN METALLURGICAL WORKS, —AND— Practical Mining School, Bryant Street, between Third and Fourth, SAN FRANCISCO.

THE PROPRIETORS are at all times prepared to work, or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphurets, pyrites, and the so-called "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

Our Patent Agency.

The PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS
 has been signified with remarkable success during the
 past two years. The importance to the inventive genius of
 this coast of a thorough and reliable agency for the solici-
 tation of Letters Patent from the United States and foreign
 Governments cannot be over-rated, and the Proprietors of the
 Press, feeling the responsibility which rests upon them, and
 the reward which must follow the faithful performance of
 their trusts, will take care to afford inventors every advan-
 tage to be secured to them through a competent and re-
 sponsible agency upon this coast.

Endorsement by the Miners' State Convention
 The following resolution was adopted by the California
 Miners' State Convention, held at Sacramento, Jan. 17th,
 1866:

Resolved, That we regard a mining paper or journal of
 great importance to the mining interests of California, and
 we recommend the MINING AND SCIENTIFIC PRESS, of San
 Francisco, to the consideration and support of the miners
 of the Pacific coast.

RUGGLES' PRINTING PRESS.
 For Sale or Exchange.
 The Proprietors of the MINING AND SCIENTIFIC PRESS have
 on hand a Half-Medium Ruggles Engine Job Press, in con-
 dition good as new, which will be sold cheap, or exchanged
 for a good Hand-Press of medium or large size.

DEWEY & CO., Job Printers,
 Office, 505 Clay street.

SUBSCRIBERS who do not receive the MINING AND
 SCIENTIFIC PRESS in due time, are requested to inform the
 publishers.

SAN JOSE INSTITUTE

Commercial College,
 SAN JOSE,
 Santa Clara County, California.

**THE NINTH SESSION WILL COMMENCE ON THURS-
 DAY, July 28th, 1866.**
 A new, practical and complete Business Course has been
 adopted, differing from that of any other School in the
 State. We call the especial attention of Business Men, or
 those wishing to give their sons a thorough, practical Busi-
 ness Education, to this fact, and request them to send for a
 Circular before deciding what School they will patronize.
 Sample resolutions for boarders in the Seminary.
 Ornamentals, Music, Ancient and Modern Languages
 taught.
 Special arrangements have been made for boys between
 the ages of ten and eighteen.
 For further particulars or Circular, address
FREEMAN GATES, Principal.
 Or, **GEO. L. HOUGHTON, Prin. Com. Dept.**

And in accordance with law, and an order of the Board of Trustees, made on the twenty-first day of August, 1886, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the said Company, No. 423 Washington street, Room No. 13, up stairs, San Francisco, on the twenty-ninth day of October, 1886, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

S. DICKINSON, Secretary.
Office, 423 Washington street, Room No. 13, San Francisco, October 31, 1886. oc6

Nuestra Señora de Guadalupe Silver Mining Company, Tayoltita District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the first day of October, 1886, an assessment, No. 25, of one dollar (\$1) per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. Frazier, at the office of the said Company, No. 210 Post street, or to the Treasurer, A. H. MELLMAN, at his office, No. 637 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the third day of November, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twenty-eighth day of November, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

F. J. PFEIFFER, Secretary.
Office, 210 Post street, San Francisco, Cal. oc6

Santa Cruz Petroleum Oil Works Company.—Location: Santa Cruz County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of October, 1886, an assessment (No. 17) of fifty cents per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, R. WEGENER, 415 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the thirtieth day of November, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twenty-seventh day of November, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. WEGENER, Secretary.
Office, 415 Montgomery street, San Francisco, Cal. oc6

And in accordance with law, and an order of the Board of Trustees, made on the twenty-seventh day of August, 1886, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesrooms of John Middleton & Son, No. 404 Montgomery street, San Francisco, on the fifteenth day of October, 1886, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Müller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; a, Dies; c, Shoes, and o, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan when properly constructed, are respectively 177, 118 and 132.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the miller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes direct from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been furnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the
PACIFIC FOUNDRY,
1st San Francisco.

LEFFEL'S American Double Turbine

THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given unusual satisfaction whenever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These Wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 50 feet fall. Let us know how much water you have either in minor's inches or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to
KNAPP & GRANT,
—ALSO—
San Francisco.

Leffel's Lever Jacks,
For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks, for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make, and kind.
For sale by
KNAPP & GRANT,
1212-13th
San Francisco.

PAGE'S PATENT FOR RAISING SUNKEN VESSELS!

SHIPPING AND INSURANCE COMPANIES, AND other parties upon this Coast or in the Atlantic States, having occasion to avail themselves of this invention, which has been tried and proven a success, will please address, for the present, JOSEPH DE VINCEY, San Francisco or at the office of the Mining and Scientific Press, 813
AUSTIN Z. PAGE, Patentee.

To Ditchmen, Millmen and Others Requiring
IRON PIPE.

M. B. ROSE, CORNER OF 9TH AND K STREETS, Sacramento City, has facilities unsurpassed on this coast for the manufacture of IRON PIPE of every description. He also has on hand a deep well FORCE PUMP, of his own invention and manufacture, well adapted for oil wells. His tools being portable, pipe can be manufactured on the ground.
1912

It tells us truly the Minute, Hour, Day of the Week and Day of the Month.

HORTON'S PATENT CALENDAR CLOCK!

MANUFACTURED BY THE
ITHACA CALENDAR CLOCK COMPANY,
Ithaca, N. Y., and for sale by
W. J. EGBERT, Agent.

At JOE M. SEAMAN & Co's, 631 WASHINGTON STREET,
San Francisco.

THIS TIME PIECE costs but a trifle more than any other good clock, and is just the article for every well-regulated business house, office, saloon, or, in fact, any place where a handsome, perfect time-keeper is duly appreciated. The Clock has two dials, the first being the same as an ordinary clock; the second has but one pointer, and shows the day of the week, the month and day of the month. It is arranged to mark the days in leap years with equal regularity. It is an eight-day piece, and runs from year to year without change. It can be examined at the Office of the Mining and Scientific Press.
215-1st St

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:
No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600
No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour.....\$850
No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour.....1,200
The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Baywide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1884. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above improved Barrel, are hereby informed that on and after the 1st November, 1886, the royalty charged for using the same will be raised to the sum of \$100 per Barrel.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1886.
Express Building, 402 Montgomery street,

EXCELSIOR PUMP!

THIS DOUBLE-ACTING SUCTION AND FORCE PUMP CHALLENGES COMPETITION, for simplicity, durability and power, and will work at any depth. The pistons for Mining Pumps are packed with hemp. The valves are reached by simply removing the "bonnets," thereby avoiding the trouble of raising a long column of pipe. They will raise as much water as TWICE their size of single-acting Mining Pumps, and are sold at half the price. We have never heard of the valves in this Pump being out of order. For their many superior points they are fast replacing all other Force Pumps. Reference can be given where this Pump is working with eighteen others of different patterns, and is pronounced THE BEST, also, from some of the best miners in the State who have them in use. For manufactories, farms or domestic use, we warrant them the best and cheapest. All sizes adapted to any power or any purpose. For sale by agents throughout the State.

J. W. BRITTON & CO.,

Union Amalgamator.

This Valuable Invention

IS FAST FINDING ITS WAY INTO GENERAL USE, NOT by means of combination of capital and influence, but on the strength of its own merits, and upon the principle that what is known to be good will be appreciated. Practical men acknowledge the UNION PAN to be scientific, the best, the cheapest, and most profitable. It now stands first on the list of all pans in use for the purpose of

Working Gold and Silver Ores.

It has been found that a low class of ores, also tailings from Mills, Sulphurets, etc., that will not pay to work with the common pans, may be worked with this and obtain large profits. The UNION PAN is manufactured in two sizes, and capable of operating upon large quantities of ore in the most efficient manner.

Parties interested in Quartz Mining, Mills, etc., will find it to their advantage to call and examine for themselves, and see its operation.

Gold and silver ores tested by regular mill process, at moderate cost, by

STRONG & CO.,

San Francisco Foundry, corner Mission and Fremont streets, where orders will receive prompt attention.

Economy in Advertising.—THE MINING AND SCIENTIFIC PRESS is the best and most economical mining advertising medium in this city. Our terms are less than one-half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonableness of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

A NOVEL SUTURE.—In a private letter from Dr. Chas. Dorat, Santa Anna, State of Salvador, Central America, he says: "I will mention a curious case of native surgery I witnessed a short time ago. The patient had received a severe stab in the abdomen, from which protruded about half a yard of intestine and a portion of omentum, the former having a longitudinal slit about three inches long. On my arrival I found an Indian *medico* had sewed up the wounded gut with the nippers of a large ant. The insect, which is very savage, was taken by the body and its head presented to the united lips of the wound, which it bit and held fast. The operator then, by a pinch of the fingers, killed the ant, [nipping off its body and] leaving its head fixed to the gut. Another and another ant thus applied, to the number of a dozen or fifteen, affected this singular suture. The gut was then replaced, and, no inflammation ensuing, the man recovered speedily. This curious practice is said to be usual in this part of Central America."

A WATERFALL OF TWO THOUSAND FEET.—The *Democrat* says there is a fall of water on the South Fork of the Tuolumne, that lays over the falls of Yo-Semite by seven hundred feet. The fall at the latter place—at least the perpendicular fall—is stated, we believe, at fourteen hundred feet, while this fall of water on the Tuolumne is given at two thousand feet. Dr. King and Mr. Gardiner, under the direction of Prof. Whitney, the State Geologist, have been exploring the section of country watered by the Tuolumne river and branches, and made this discovery of this fall. The gentlemen visited Sonora the other day, and after remaining a day or two, returned to the falls, where they intend to make a complete survey. The country is described as beautiful, and the valley where the falls are situated enchanting.

STILL ANOTHER "BANKER" MINE.—The *Downieville Messenger* gives a brief description of a mine near that place, which we should judge somewhat resembles the celebrated Banker mine, near Lincoln:

The Chappai quartz claim, situated about one mile northerly from Downieville, near the Monte Cristo trail, has been heretofore worked as a placer claim, being in a talcose formation—which is much decomposed near the surface. Water, with the help of the pick, has heretofore been quite sufficient to free enough of the gold to make it quite remunerative property to the owners. Recent developments have proved its continuity in depth, with a very rich class of auriferous ores. The ores now being quarried are so rich that the proprietors are packing them to be put away for safe keeping.

TRAVELERS and geologists have been at a loss to account for the origin of the masses of asphalt, sometimes of considerable size, found floating on the water of the Dead Sea. In a paper recently presented to the Academy of Sciences by M. L. Lartet, "On the deposits of Bitumen in Judea, and on the Asphalt of the Dead Sea," the author states his belief in the existence of a series of hot springs which rise through bituminous limestone and bring up the asphalt.

The curvature of the earth amounts to seven inches per mile. A man six feet high cannot see from a distance of ten miles.

Auction House.—Messrs. Olney & Co. have opened a General Auction and Commission House, No. 418 Montgomery street—a very central and convenient location. Mining and other Corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Besides every kind of auction business, this firm will pay special attention to the purchase and sale of real estate in Oakland.

STOCK CERTIFICATES, STOCK TRANSFER JOURNALS, STOCK LEDGERS, ASSESSMENT RECEIPTS,

And all other Blanks, Blank Books, etc., required by Mining and other Corporations, kept on hand or printed to order on short notice, at moderate prices, at the office of the MINING AND SCIENTIFIC PRESS.

BROWN & BEADLE,
Offer their services to
INVENTORS AND THEIR ASSIGNEES,

PATENT SOLICITORS.

They will make Preliminary Examinations in the Patent Office, with a view to ascertain the Patentability of any invention that may be submitted to them for that purpose; will prepare the necessary papers for those who wish to make Applications for

ISRAEL W. KNOX, or
W. A. PALMER, Inventors,
At the Golden State Iron Works, No. 19 First street, San Francisco.

CAUTION!

NOTICE.—TO WHOM IT MAY CONCERN.—THE PUBLIC are hereby notified that a patent was allowed Dec. 27th, 1864, and issued June 27th, 1865, to Professor Henry Wurtz, for the use of Sodium and Amalgams thereof with quicksilver, in the extraction of precious metals from their ores. All persons using said Amalgams, or purchasing or selling Sodium or said Amalgams, for use in the treatment of gold or silver ores, are hereby cautioned that they will be prosecuted to the full extent of the law.

SODIUM OR MAGNETIC AMALGAM.

Assignees of letters patent granted to Prof. Henry Wurtz, the discoverer of the use of Sodium in the amalgamation of gold and silver ores, having established an agency in San Francisco, now offer to the mining community their amalgams, with full directions for their use, on the MOST LIBERAL TERMS. A large supply of the Amalgam, of any required strength, constantly on hand.
The terms and conditions upon which rights to use the process are obtainable, can be had on application to

ANNUAL REPORT OF THE Pacific Insurance Company.

IN COMPLIANCE WITH THE ACT OF THE LEGISLATURE of the State of California, entitled "An Act concerning Corporations," passed April 22, 1860, the Pacific Insurance Company of San Francisco makes the following Annual Report:

I.—The amount of the Capital Stock of this Company is SEVEN HUNDRED AND FIFTY THOUSAND DOLLARS, and paid in GOLD. \$750,000
II.—The amount of the Assets is ONE MILLION AND FIFTY-ONE THOUSAND, FOUR HUNDRED AND TWENTY DOLLARS AND THIRTY-SEVEN CENTS. \$1,051,420.37
III.—The Company has NO DEBTS.
IV.—The amount of insurance effected during the year, and which remained in force December 31, 1865:
Fire. \$12,973,949
Marine. 484,408
This Company commenced underwriting Marine Risks, August 1, 1865.
V.—This Company insures against the following risks, viz: BUILDINGS, HOUSEHOLD FURNITURE, MERCHANDISE, RENTS, LEASEHOLDS, VESSELS IN PORT AND THEIR CARGOES, and other PERSONAL PROPERTY, AGAINST LOSS OR DAMAGE BY FIRE.
Also, on CARGOES, TREASURE, COMMISSIONS, PROFITS, AND WAR RISKS, AND ON ALL MARINE AND INLAND NAVIGATION RISKS, TO AND FROM ALL PORTS IN THE WORLD.
VI.—This Company will take on any FIRST-CLASS RISK not to exceed \$75,000 (the limit fixed by law), and on all large risks will reimburse to an extent consistent with PRUDENCE in other RESPONSIBLE COMPANIES.

Book Printing should be considered and treated as one of the higher branches of the "Art of Arts," and its execution entrusted only to experienced and intelligent workmen. Strict attention will be given to all orders for BOOK AND PAMPHLET PRINTING entrusted to the Mining and Scientific Press Job Office.

THE MINING PRESS comes loaded with a rich variety of mining intelligence, and all sorts of scientific interesting matter.—[Amador Ledger.]

Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

HOADLEY'S.
FOUR SIZES,
8, 10, 12, and 15-Horse Power,

HOADLEY'S.
3 to 40-Horse Power.

HITTINGER'S.
THREE SIZES,
5, 7, and 10-Horse Power

HITTINGER'S.
TWO SIZES,
5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes. Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises), enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with an without carriages.

Also, Portable Saw and Grist Mills.
For sale by
TREADWELL & CO.,
15v12 Corner of Front Market and streets.

NEW PATENTS AND INVENTIONS.

Under this heading we shall mention, from week to week, as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

NEW INVENTIONS.

IMPROVED WAGON TIRE.—The Contra Costa Gazette speaks of an improved wagon tire, recently invented by J. G. Still, and exhibited at the late fair in that county. The improvement is simple and inexpensive, and its application will insure a great saving in the expense and trouble of tire setting, and an incalculable saving in the wear of wheels, to the shrinkage of which in dry weather, and the swelling in wet weather, the adjustment of the tire can be made in a moment. The mechanism of the improvement is not described.

AN ARTILLERY IMPROVEMENT.—Francisco Gonzalez, a native of Mexico, and a civil engineer now residing in this city, has invented a rifled breech-loading cannon which is believed to be more simple, powerful and effective than anything in the line hitherto produced. The model can be seen at the Mexican Consulate, on Bush street. We learn that it is the intention of the inventor to submit it to the examination of experienced military men, and if approved, to apply for a patent. The construction of the gun is entirely new in principle. Instead of the permanent breech, as with muzzle loaders, the piece is bored through from end to end, so that a person can see directly through it. A chamber is made by boring down from the vent through the core. The chamber thus created is considerably larger than the bore of the gun. This chamber is filled by a solid mass of iron through which the bore and rifling is carried. By turning a lever the chamber is closed completely, the plug swinging around exactly like the horizontal piece of a common wooden faucet, and forming an air tight breech. The advantage claimed for this arrangement is that it enables three men to do the work of a dozen by the old system of muzzle loading, and affords perfect protection to the artillerymen, who can work the gun while it projects from a case-mat or port-hole, without being seen by the enemy.

PATENTS RECENTLY ISSUED.

PUMP.—Wm. D. Hooker, San Francisco claims a vertical and inclined partition in combination with the suction valve seats, and discharge valve seats; the whole arranged as described by him, and for the purpose specified. Patented August 15, 1865; reissued August 1866.

PATENTS can be obtained for citizens on this Coast through the MINING AND SCIENTIFIC PRESS PATENT AGENCY, in *one-half* the time it takes to operate through Eastern agents. From our familiarity with the subject of most California inventions, and the benefit arising from personal explanations, we are prepared to present claims with greater accuracy than could reasonably be expected of distant agents. Advice and Circulars FREE.

Figure 1.

Figure 2.

Hendy's Improved Patent Self-Discharging Sulphurets

PRATER CONCENTRATOR

Is Receiving Universal Favor.

Reference is made to the following Mills which have them now in use:

BENTON MILL, Bear Valley, Mariposa County.
LOUISIANA MILL, near Coulterville, Mariposa County.
OPHIR MILL, near Newcastle, Placer County.
C. H. SCHNABLER'S MILL, Doty Flat, Placer County.
JERSEY BLUE, near Folsom, Cal.
SPRING HILL MILL, Amador, Amador County.
GOLDEN GATE MILL, Volcano, Amador County.
RAWHIDE MILL, Jamestown, Tuolumne County.
TRIUNFO G. & S. M. CO., Lower California, Mexico.

And in use in many other parts of this State; also in Idaho, Arizona, Colorado and Mexico. They may be seen in operation at the GOLDEN STATE FOUNDRY, No. 19 First Street, San Francisco.

DESCRIPTION:

FIGURE 2 is a sectional view. C, is the Hopper in which the tailings are thrown. The tailings then distribute on the Distributor, B. The tailings enter the pan, A, at its periphery, and the debris discharges near its center, and passes off in the spout, F. The sulphurets discharge at gate, E, amalgam and quicksilver at plug, I. J, is a horn-shaped cavity for collecting quicksilver and amalgam. S, is the sulphurets. M, M, the agitating bars, with copper plate, coated with mercury.

The agitating bars operate on top of the pulp. They are acknowledged to be, by those using them, a valuable improvement. [An extra charge of \$15 is made when these bars are furnished.] The pan, A, shows a curve-linear bottom, which gives a more precipitous descent near its center, for the purpose of forcing the sulphurets towards the periphery. It will be noticed that the centrifugal force diminishes towards the center of the pan, for which reason the inclination is increased for the purpose above mentioned.

The pan, A, has an inclination at its periphery, towards the gate, E, for the purpose of forcing the sulphurets to the discharge gate. At the same time the center rim is level; the sulphurets, S, being forced by the oscillating motion of the machine, and are discharged through a small opening in the pan at gate, E.

Certificates:

JOSHUA HENDY, Esq.—Dear Sir: I have been using three of your Improved Concentrators for the past four months, at the Spring Hill Mill, and they give perfect satisfaction.
Yours truly,

AMADOR, July 20th, 1866.

WM. H. HOOPER.

JAMES TOWN, TUOLUMNE COUNTY, CAL., July 13th, 1866.
JOSHUA HENDY, Esq., San Francisco:—MY DEAR SIR: I have the pleasure to inform you that the four "Improved Self Discharging Prater Concentrators," which I purchased from you, have now been in operation in the Rawhide Mining Company's Mill for more than two months, and have more than realized my expectations.

I am free to say it is the best Machine for saving Quicksilver, Amalgam, and Sulphurets that I have ever used or seen used for that purpose. I shall take pleasure in showing any one interested the Machine in operation, who will at the mill. I shall need four more as soon as the balance of our mill is completed. Yours truly,

R. P. JOHNSON, Superintendent Rawhide Mill Company.

A Circular giving further particulars will be mailed to any part of the United States free of expense. Address,

JOSHUA HENDY,
402 Montgomery street, San Francisco, Room 3, Fourth Floor.

WORDS FOR MINERS.—The Gold Hill Daily News, Nevada—a medium of good authority—saith thus:

The MINING AND SCIENTIFIC PRESS is a weekly Journal, published in San Francisco, which is entitled to the subscription patronage of every practical miner in Nevada, and every person interested in Nevada or California mining operations. It is a well gotten up sixteen-page quarto; and its reading would tend vastly to the particular "posting" and general enlightenment of our sort of working folks. Subscribe for it. Five dollars a year; three dollars for six months. It should have an agency in Virginia and Gold Hill; but we see none advertised in its columns. Every new improvement in mining implements and operations are fully described by words and illustrated by wood cuts in this excellent publication. A specimen number can be seen at our office.

Those marked with an asterisk () are advertised in this journal.

YIELD OF NEW ALMADEN.—Sixteen thousand seven hundred flasks of quicksilver were received from the New Almaden mine during the first nine months of 1866. The number exported during the same time is 24,483. For the first nine months of 1855, the export was 29,819.

AGRICULTURAL AND MINING COLLEGE.—The committee have made proposals for securing the location of the Agricultural and Mining College. The Board of Directors meet in San Francisco on October 15th, to determine upon the site.

BLACK MARBLE.—Some one informs us, by letter, of the discovery of a quarry of black marble and a superior deposit of lime, near Dutch Flat. Our correspondent neglects to send us his real name, without which no communication can be considered.

BRODIE'S PATENT QUARTZ CRUSHING MACHINE.

The annexed engraving represents one of a well known class of machines which is steadily coming into use for reducing the quartz from the condition in which it is received from the mine to a size suitable for being placed under the stamps for further reduction. A large amount of labor is saved by these machines, and the rock is much better prepared for the stamps than when it is done by hand. We have here a perspective view. We give the inventor's description as follows:

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame, of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary

jaws. Letter A represents the eccentric shaft by which this power is applied direct to the movable jaw. Letter B represents the movable jaw, and C the fixed jaw. Letter D represents the link or radius bar. Letter E represents the bolts for regulating the opening, F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. Letter G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

Those who have witnessed the working of the machine, are astonished at the ease with which it is made to operate, and its simplicity of construction and great strength. It is claimed for the machine, that with equal power for work, it is of considerably less weight than other machines of a like character, an item of economy not only as respects original cost, but will be found specially important at mines situate in remote places, and of difficult access.

Three sizes of crushers are manufactured, viz.: Openings, 10 in. by 7 in., 15 in. by 7 in., and 18 in. by 9 in., at the Fulton Foundry, in this city, where the machine can be seen in operation.

For the capacity for work and prices, the reader is referred to the advertisement of the proprietors, Messrs. Brodie & Radcliffe, in this paper.

MAGNESIUM IN THE ARTS.

Magnesium is now made in Boston, on a somewhat large scale, from dolomite or magnesian limestone, by the Sonstadt method. The principal use for the metal hitherto has been to burn for light, the acting power of which is 1-36th that of the sun, though the intensity of the light is 1-525th that of the sun. Numerous other employment in the arts will, doubtless, be found for magnesium, as soon as its properties become more generally and more fully known.

M. Roussin has recently published a paper on the action of magnesium on metallic solutions, and on its application to toxicological researches, which shows that magnesium is particularly well adapted for the precipitation of other metals from solutions of their salts. A large number of very interesting experiments in this direction are reported by M. Roussin. Among others, he observes that a sodium amalgam, shaken up with an acidulous solution of salt of chromium, or a salt of manganese, changes to an amalgam of chromium or of manganese, as the case may be; and that as amalgam of either of these metals, obtained in the manner indicated, when distilled in a current of hydrogen, after having been first carefully washed in acidulated water, leaves the pure metal in the form of a fine, spongy powder.

He shows that magnesium is particularly well adapted for the precipitation of other metals from solution of their salts. Quite a number of metals have hitherto resisted all attempts to precipitate them by the use of other metals; but, with two or three exceptions, Mr. Roussin has found that these are all readily precipitated into their metallic state by the use of magnesium. The two exceptions are chromium and manganese, which are both thrown down, however, but in the condition of oxides. Aluminum is not precipitated at all.

The use of magnesium in fireworks gives the lights a most magnificent brilliancy, such as is attainable in no other way. Several European governments are now engaged in experiments, with the view of its application to light houses and coast and sea signals. It is also beginning to be used for examinations with the speculum in surgical operations.

For workers and dealers in colors, the magnesium light is superior to all others, for the reason that by its rays colors can be distinguished as readily as by sunlight. These are some of the many uses to which magnesium have been already applied. Further researches, and its cheaper production will, doubtless, ere long, lead to its much more extended and varied application in the arts.

NEW FIRM.—Messrs. Bacon & Stewart, at No. 51 Beale street, practical machinists, have formed a copartnership for the business of making and repairing all kinds of machinery. Particular attention paid to printing press work, in which branch of the business Mr. Stewart has had several years experience. They respectfully solicit the patronage of the printing fraternity.

The presence of alcohol in etherial oils may be detected by fuchsin, which is soluble in alcohol, but not in etherial oils.

THE USE OF COSMETICS.—CHEMICAL PHENOMENA—LADIES BEWARE.—A lady in this city, and one somewhat noted for the delicate beauty of her complexion, noticed a few days since, the sudden appearance upon her person of great numbers of pimples, like groups of little volcanoes, which threatened to cover her beautiful neck and arms with pathological arabesques. Under the advice of a physician, whom she had called in, she ordered a medicated bath; and with the hesitation of a woman of delicate nerves she gradually submerged her person. Scarcely, however, had the sulphurous wave enveloped her form, ere, from head to foot, the delicate white of her person was changed to Ethiopian bronze. Ignorant of the fact that the change of color was due to her almost daily habit of whitewashing herself, so to speak, from head to foot, and fearful lest the sudden transformation of her person was due to an attack of the cholera, she again hastily summoned her physician, who, when he arrived, could scarcely preserve his dignity on witnessing the changed appearance of his patient.

"Madame" said he, with all the gravity he could summon, "be not alarmed: you are not ill; you are merely a most remarkable chemical product. You are no longer a woman; you are a sulphuret. It is not now a question of medical treatment which I have in my hands; but a simple chemical reaction which I must bring about. I shall analyze you. First I shall submit you to a bath of sulphuric acid, diluted with water. The acid will have the pleasure to combine with you—will take up the metal and sulphur with which you have so plentifully covered your person, and will produce a sulphate. We shall then find, as a precipitate a very pretty woman." Fair dames, let this incident serve you as a lesson—never use a white powder which has a metallic base.

THE COLORADO METEORITE.—Not being fully satisfied of the mineralogical character of the specimens sent us from Colorado by Mr. Smith, we submitted them to Prof. Blake, who has sent us the following note:

"One of the specimens you sent to me is, unmistakably, a fragment of meteoric iron, having a peculiar characteristic crystallization, which is not often visible until a polished surface has been etched with nitric acid. In this specimen, however, the fracture alone develops the crystalline figures, and in a most marked degree. It was this unusual appearance, and the oxidized surface, which very naturally led you to doubt its simple metallic character. The fragment is doubtless from the same meteorite noticed by Professor Shepard in the *Journal of Science*. He notes its similarity to the celebrated meteorite of Arva. It contains grains of schreibersite—a hard mineral which somewhat resembles magnetic pyrites. The other small fragment sent appears to be a detached nodule of the schreibersite, but this cannot be affirmed positively without further examination."

QUARTZ MINERS' INCOMES.—Jules Fricot, a Nevada quartz miner, gives his income for 1865 as \$182,511. This is the largest tax returned in California. The next largest is that of James P. Pierce, also a mine owner, who resides in San Francisco. The figures are \$102,031.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

Notes on the Chief Gold Districts Throughout the World.

BY PROFESSOR ROWLANDSON, F. G. S. L.

(Continued from Page 210.)

BRITISH COLUMBIA

May be briefly dismissed with a few remarks. The Cascade range, whether considered as a spur or irregular continuation of the Sierra Nevada, does not, from all accounts, appear to vary much either in physical or geological features from the latter named range; the chief one, probably, being that, in parts, the mountains composing it are more abrupt and rugged; that quartz is found in more massive forms and in greater abundance; also that volcanic action is not yet extinct. From what is known of the geology of Vancouver Island, the coal district of Bellingham Bay, etc., it may be strongly inferred that the cretaceous rocks extend throughout the whole of this auriferous region—one possessing some remarkable features, and comparatively unexplored. The Cariboo alluvial gold field could only have been supplied from the decomposition of rocks containing very rich gold veins. A specimen from this neighborhood, of a remarkable character, was recently shown to the writer. It consisted chiefly of compact titaniferous iron (the disintegration of which would form the well known black sand), along with some minute crystals of quartz, throughout the central portions of which, ramifying in every direction, iron pyrites and gold was discernable. This portion of the North American Continent may be dismissed, with the observation that, so far as discoveries have been made, it is highly probable that the Laurentian and Huronian rocks of Canada and Northwestern New York are not to be found to the west of the Saskatchewan.

CALIFORNIA, NEVADA, NEW MEXICO, OREGON, ETC.

The detailed consideration of the geological features associated with the extensive territory comprised in the above sub-heading, need not now be dwelt upon, as much has already been written by me, and been previously published in the MINING AND SCIENTIFIC PRESS and *Alta*. Notwithstanding the ignorance, real or assumed, exhibited by Professor Brewer, in an article which appeared in the last July number of Silliman's *Journal*, as to any one having "surmised," to use the Professor's term, that the gold bearing rocks of California were of an age so recent as the Cretaceous; the facts, when written truly, are, that in the *Alta California*, I distinctly, in the year 1863, announced my strong conviction that although paleontological evidence was then absent, when such should be discovered, the gold-bearing rocks of California would be found as high as the Jurassic. That Professor B. may not have seen the original is probable; he might, however, have easily ascertained whether such was the fact or not. He observes: "I cannot positively deny that such surmises (the italics are Professor B's own) may have been printed, but I never saw them until after September, 1864; since which date certain writers have recollected that they had arrived at these conclusions, and are now putting forth claims for their discoveries." In the first place, I may remark that I am not aware that any one but myself, either before or since 1864, has put forth, on general principles, any claim indicative of the theory that gold-bearing rock, either in California or any other part of the world, might possibly be discovered amongst rocks belonging to the secondary series; the inference, therefore, is very strong that the writer or writers referred to can only apply to myself. If such is the fact, Professor Brewer's only opportunity of perusing any claim of mine on this subject must have been the re-publication in the MINING AND SCIENTIFIC PRESS of part of my early series "On the Age of Gold-Bearing Rocks," which originally appeared in the *Alta*, in which re-publication the original date was

referred to, and must have been seen by Professor Brewer, if I am correct in the above "surmise." The assertion of Professor Brewer, that the fact of the sedimentary portion of the metalliferous belt of the Pacific coast of North America is chiefly made up of rocks of Jurassic and Triassic age, etc., has been known some years, only distantly bears on the point at issue respecting that of establishing the fact, that auriferous veins exist in close proximity to beds containing fossils of secondary age. The latter fact was first publicly demonstrated by Professor W. P. Blake, in his communication to the California Academy of Sciences, October 4th, 1864, and published in their transactions shortly afterwards, at the reading of which Professor B. was present, certainly before the State Geologist asserted that similar fossils to those described by Professor Blake had been found by Mr. Clarence King in the same neighborhood (near Hell Hollow) where Professor Blake had obtained his specimens.

Direct reference was not published respecting the latter, by the State Geologist, until the appearance of the first volume of Paleontology, which was not published until the year 1865, had considerably advanced. A casual reader and observer, from the date and place given in the volume noticed—namely, "Geological Survey, California, September, 1864," would infer that the above passage was written in this State, and possibly at the time named. The fact, however, is this: Mr. Whitney was not in California at that time, as may be seen by reference to the September number of Silliman's *Journal*, wherein it will be seen that that gentleman dates an article "Northampton, Mass., August 1st, 1864," and certainly did not return to California until about the fall of the following year.

Again, in Appendix B, of the first volume of the Geology of the State, dated November 1st, 1865, the State Geologist observes: "The first Jurassic fossil found in the auriferous rocks of California, were from Genesee Valley, and described by Mr. Meek, Sec. 2, Vol. I., of the Paleontology of California. These were discovered and collected by Brewer and King in 1863. In the January following Mr. King found belemnites in three places near Hell Hollow."

Now, it may be asked, if ample proof existed of the Jurassic age of the auriferous rocks at Genesee Valley, in 1863, why was the fact unnoticed in the first volume of Paleontology, and allusion only made to the asserted discoveries of Mr. King, in Mariposa county, in the course of the following year.

The value of the Genesee discoveries, as associated with the determination of the age of auriferous-bearing rocks, from the silence observed on this point, must appear to any disinterested observer to have been an after-thought, induced by the subsequent discoveries in Mariposa county.

It may be here well to remark, also, that proximity alone would not suffice to establish even a comparative identity of age with an adjoining metalliferous vein; such a thing might occur by a great down-throw, by which fossiliferous beds of secondary age, like the Jurassic beds discovered near Bear Valley, might be found abutting on, and in direct contact with powerful auriferous veins, like the Pine Tree and Josephine, yet the latter be associated with beds of much more ancient date.

Such phenomena are well known in connection with the stratigraphy of ancient and more recently formed rocks, and to a considerable extent can be illustrated in the case of mineral veins other than those which are auriferous.

The observations made by Professor Brewer, in Silliman's *Journal*, and referring to Professor Brewer's somewhat irregularly inserted remarks in the "Proceedings of the California Academy of Science," are quite beside the question at issue. Drs. Veatch and Trask (formerly State Geologist), several years before the Genesee discovery, found, described, and, in some instances, figured, fossils belonging to the secondary rocks which had been obtained by them in California. These discoveries were made several years prior to the appointment of Professor W. as State Geologist. I have more than once imparted my views to these gentlemen respecting the probable age of the gold-bearing rocks of this State; to the former at least seven, and to the latter probably ten years ago. Believing that I am the only person, prior to the fossil discoveries above dwelt upon, who, on general principles, propounded the opinion that future investigation would establish the existence of gold-bearing veins in rocks more modern than the Silurian, and possibly even of Tertiary age, it may be easily conceived that I have been, during my residence in California, extensively alive to any matter calculated to illustrate and establish such an opinion. However anxious to estab-

lish my theory on the basis of facts, I have been disappointed, until made aware of the fossil discoveries near Bear Valley, above alluded to, not because I was unaware that fossils of Secondary and Tertiary age had been found for 500 miles from Shasta to San Diego, and for 200 miles at points bordering on the auriferous district; but simply because, until the discoveries published by Professor Blake were made known to me, the close association of such fossils with any adjacent gold vein had not been established. In fact, Professor Dann, in the 1863 edition of his "Manual of Geology," stated that cretaceous rocks were found, "according to Whitney, at various points on the Coast Range in California, and along the foot-hills of the Sierra Nevada, from Placer county to Shasta." But neither Whitney nor Dana at that time attempted to associate these cretaceous rocks with gold-producing veins.

(Written for the Mining and Scientific Press.)

Mining in Central Nevada.

EDITORS PRESS: It seems to be a general impression in California that the only kind of mines we have in the Reese River country, are the small spotted ledges discovered in the spring of 1863, and that in reality there is nothing in the Great Basin deserving of the attention of capitalists or operators in mines. Than this there can be no greater mistake; probably the most valuable silver mines which have ever been discovered in any part of the world, are located in the central and southern portions of the State of Nevada. Our best mines, it must be admitted, are of recent discovery, and as it may be interesting to your readers, I proceed to give you a slight description of the two mining districts where the richest ledges have been found.

SILVER BEND.

This district is about twenty five miles north of San Antonio, on the eastern slope of the mountain range east of Smoky Valley. It is eighty-five from Austin, in a southeasterly direction. The belt is of slate, and not over half a mile in width, there being only two or probably three main lodes within it. One of these is the celebrated High Bridge mine, which, though purchased by the Combination Silver Mining Company of New York, and the David E. Buell, at a cost of a few thousand dollars, will probably be found of greater value than even the Comstock, when an equal amount of work shall have been performed upon it. For at least a thousand feet the vein shows ore on the surface which assays from \$200 up to \$3,000 per ton. The ledge appeared to be only about three feet in width when discovered in May last; but now, after it has been opened to the depth of twenty-five or thirty feet, a body of the richest kind of ore has been exposed at least twenty feet wide. Mr. Buell has had a 10-stamp mill at work in the district for several weeks, and although he has no facilities for roasting the ore, and cannot work it closer than fifty per cent. of the fire assay, he is netting \$150 per ton. A run of fifteen days, with five stamps, yielded over \$12,000 in bullion; the expenses of mining and milling being only \$4,500.

It is the intention of the Combination Company to erect a 60-stamp mill next spring, and the Canfield Silver Mining Company of New York, who own ground on the same lode, have secured a working capital of \$350,000, and intend to prosecute their operations with the vigor which the value of the property demands.

HOT CREEK.

About thirty miles northeast of Silver Bend is the District of this name, so called because a volume of hot water, issuing from a series of springs, makes a creek of respectable proportions, at least in a country where every little rivulet is so named, and where an extraordinary creek is termed a river. The belt here is much more extensive than that of Silver Bend, being at least two miles in width, and traceable for ten or twelve miles. The formation is talcose slate, capped with limestone, in which ancient sea shells and coral are abundant. Where the limestone has been stripped off by the action of water the lodes are found large and well defined; but when they crop out only through a heavy cap, the walls are not generally visible near the outcrops, and the mineral appears in small seams, as if struggling to reach the surface. By the expenditure of a small amount of labor, however, the ledges are usually exposed so as to show a fine, compact body of ore of high grade. The old Dominion, one of the best locations in the district, scarcely cropped through the limestone; but now, after a few days' work, it shows fifteen feet of first-class milling ore, assaying from \$100 up to \$5,000 per ton. The Gazette and Keystone ledges also showed very little min-

eral on the surface, when first discovered; but are now esteemed of great value. The Indian Jim, on the other hand, having been laid bare by the action of water, stands boldly out of the ground at least a hundred feet in height, and has probably not less than 50,000 tons of milling ore in sight. This ledge is certainly forty to fifty feet in width, and along its course shows more mineral than has ever been seen in any unprospected vein on the Pacific Coast.

The Silver Glance and the American Hunter are also two ledges of great promise. They are wide as well as rich, and can be traced for several thousand feet. Some of the mines referred to have recently changed hands at fair prices, and several mills are likely to be built in the district during the winter and spring months. Even assuming that the amount of \$100 to \$200 ore, obtained without any underground mining, were all the mills would have to depend on to keep them in work, a dozen would have all they could do for the next five years in reducing it. These are the mines to which the attention of capitalists is now being turned, and in a few months hence you will have good accounts of their yield of bullion.

DEVELOPED MINES.

Experience has proved that shallow mining by means of inclines and short tunnels, is far from being profitable. The mines around Austin, with their rich chloride ores on the surface, were generally opened by inclines; but as it was found that the ore became poor near the water line, the miners got discouraged, and declared the ledges were not deserving of being further developed.

Recently, however, a system of deep mining by perpendicular shafts has been adopted, with the most satisfactory results. The Great Eastern, at a depth of 500 feet, has a ledge three feet wide, and is now yielding from \$2,000 to \$3,000 in bullion. The Savage, Diana, Morgan & Muncey, Old Colony and Camargo mines are all doing well; in fact every mine-owner is now convinced that depth is all we require to give us mines of undisputed value. There have been many foolish investments made in Reese River District, and in cases where even good mines have been sold to Eastern purchasers, the management has been so bad that nothing short of a miracle could have secured a dividend to the anxious and befuddled shareholders. Everything will find its own level after a little, and time will prove that we have mines of great value even amongst the "razor blades" in and around Austin.

The Murphy mine, in Twin River District, fifty-five miles south of Austin, is looking better now than it ever did before. The lode is twenty feet wide, and 1,200 tons of ore are lying on the dump, which it is estimated will yield at least \$150 per ton. This mine was purchased last year by an Eastern incorporation for \$50,000 in gold, and is now provided with a splendid 20-stamp mill, which will start in two weeks. The Twin Ophir mine, fifteen miles north of the Murphy ledge, is found to be over twenty feet in width, and its antimonial sulphuret ore yields \$100 in the mill with scarcely any assortment.

This property, consisting of three parallel veins, was bought some months ago by a New York company for \$90,000 in currency, and will have a good mill erected upon it next spring. The Cortez mill, seventy-five miles north of Austin, is now a success, and is yielding a steady stream of bullion. It is said that the mine the company are working upon is opening in a most encouraging manner.

Austin, Sept. 28, 1866.

DELTA.

Idaho Correspondence.

EDITORS PRESS: There is some excitement here, at the present time about a false bed rock. Some miners have gone through this false rock at Placerville, and have found another bed of pay gravel, about four feet thick. It pays well. Parties have also gone through it at Centerville, and found good pay. I have also got a claim on Big Muddy creek, under this false bed rock, which pays well. To-day, I got over five dollars on one shovelful of dirt. It will not all prospect that way, however. It is said that they have also struck the same kind of diggings at Idaho City.

Should these false bed rock diggings prove extensive, they will open a new field for mining in this basin.

A piece of quartz and gold was found last week on Grimes' creek, weighing twenty-six ounces; there is about three hundred dollars in gold in it. I think there are some very rich ledges in this country somewhere. The Elk Horn quartz mill is now paying well under the new management. Yours, J. H.

Pioneer City, Idaho Ter., Sept. 17.

[We should be pleased to hear further from our correspondent with regard to this "false bed rock." What is its composition, how thick is it, how extensive, etc.? A brief mention was made of it in our mining summary of last week.]

Mechanical.

DANFORTH'S STEAM GENERATOR.

We have heard but little, of late, from this new principle of generating steam. The American *Artisan* of August 29th, says that one of these generators has been working for over a year at the works of P. W. Neefus, 231 West street, New York. It appears to be worked at a lower pressure than we had supposed this engine was intended for—100 to 107 lbs., with the temperature of the steam at about 460°, or 133° superheated. The performance, according to one day's operation, is reported as follows: "Indicated horse-power, 8.5. Water, per hour, 180.8 lbs. Coal, per 12 hours, 600 lbs.—50 lbs. per hour. Water, per hour, per indicated horse power, 21.3 lbs. Coal, per hour indicated horse-power, 5.89 lbs." Further observations are to be made, which we shall report as soon as received. No especial efforts have yet been made to economize fuel by consuming smoke, gases, etc. The work is merely experimental, and the experiment has so far been confined to simply showing that steam can be safely and economically generated on this principle. When that is fully done—and perfect confidence in the result is thus far manifested—economy in the use of fuel so employed will be looked after, with a proper class of experiments directed particularly to that object. The experiments of Perkins, McCurdy and others, forty years ago, and others still, in this country at a later period, have already indicated that a considerable advantage may be gained from the adoption of this mode of generating steam. The question appears to be simply one of details, the conclusion to which must be arrived at by a lengthy and careful course of experiments. These experiments are now in progress, and, we presume, in efficient and competent hands. We shall continue to watch their development with interest, and report thereon whenever anything worthy of note transpires.

UTILIZING EXHAUST STEAM.—MONS. P. VABE has got up an engine with two pistons on one rod, on the principle of the "Wolfe" engine. Steam is distributed by one valve. He claims that the exhaust steam in the large cylinder, whose area is double that of the small one, is as effective as it has been in the small one when it was first used; that is, the effect of the steam is doubled. There are many experiments on this kind of engine, indicating that the high pressure and low pressure engines, with the aid of surface condensation, are likely to work together. This idea is, of course, founded upon the correctness of the theory of those who advocate the plan of working steam expansively. The American *Artisan*, in alluding to the above, says: "We confess our faith in the utility of expansion, and believe that when locomotive-boilers and engines are put on board ship, and exhaust into low pressure boilers, there will be a great saving of fuel."

EXTRAORDINARY RESULTS OF SYSTEMATIZED LABOR AND IMPROVED MACHINERY.—By the systematic arrangements of labor, and the great improvements in machinery, recently introduced into the workshops of England, very superior "Barlow" knives are now turned out at a cost of about five cents each; while a very common knife is produced for about one and a half cents—less than two cents for the blade, handle and manufacturer's profit! Making full allowance for the sad commentary which this fact presents with regard to the miserably low equivalent which English operatives receive for their labor, it, nevertheless, affords a most striking evidence of the vast benefits derivable from modern machinery, and the admirable systematization of labor which is now introduced into all large manufacturing establishments.

RUST ON IRON—PAINT.—Every particle of rust on iron may be removed by first softening it with petroleum and then rubbing well with coarse sand-paper. To paint iron, take lamp-black sufficient for two coats, and mix with equal quantities of Japan varnish and boiled linseed oil.

COAL CUTTING BY MACHINERY.—A coal cutting machine is in operation in a coal mine near Leeds, England, that will cut a length of forty feet per hour, and which is so simple in construction and operation, that any ordinary miner can work it, and with but little of the risk to which he is ordinarily exposed. It is said to do the work of twenty men, at an expenditure of thirty gallons of water per minute, working at a pressure of 300 pounds per inch. It works on rails laid along the drift, so that it is easily moved and operated by one man. The cost of coal got by hand, at the mine, is about seventeen cents per ton; the cost with this machine is from six to ten cents. A model of this machine was shown and explained at a late meeting of the Institute of Civil Engineers, where it attracted much attention, as reported in *Chamber's Journal*. Why cannot coal cutting machines be economically introduced into the coal mines of the Pacific coast, where labor is so much higher than it is in the European mines?

THE FIRST ROLLING MILL was invented and put in operation in 1785. The modern method of manufacturing iron was introduced at that time; at which period the price was from \$85 to \$95 per ton. The great reduction in the cost of this universal commodity, and which has been gradually made from the figure named, to its present price, has been in consequence of further improvements which have been from time to time introduced into the various processes of its manufacture.

LACQUEAS are used upon polished metals and wood, to impart the appearance of gold. As they are wanted of different depths and shades of colors, it is best to keep a concentrated solution of each coloring ingredient ready so that it may at any time be added to produce any desired tint. We append several receipts for making different kinds of lacquers:

1. *Deep Golden-colored Lacquer.*—Seed lac, three ounces; turmeric, one ounce; dragon's blood, a quarter of an ounce; alcohol, one pint. Digest for a week, frequently shaking. Decant and filter.

2. *Gold-colored Lacquer.*—Ground turmeric, one pound; gamboge, an ounce and a half; gum-sandarach, three pounds and a half; shell lac, three-quarters of a pound (oil in powder); rectified spirits of wine, two gallons. Dissolve, strain, and add one pint of turpentine varnish.

3. *Red-colored Lacquer.*—Spanish anatto, three pounds; dragon's blood, one pound; gum-sandarach, three pounds and a quarter; rectified spirits, two gallons; turpentine varnish, one quart. Dissolve and mix as the last.

4. *Pale Brass-colored Lacquer.*—Gamboge, cut small, one ounce; cape aloes, ditto, three ounces; pale shell lac, one pound; rectified spirits, two gallons. Dissolve and mix as No. 2.

5. *Seed lac, dragon's blood, anatto, and gamboge, of each a quarter of a pound; saffron, one ounce; rectified spirits of wine, ten pints. Dissolved and mix as No. 2, forms a very excellent lacquer. Lacquer should always stand till it is quite fine before being used.*

THE LONDON PNEUMATIC DISPATCH, by which small parcels are transported from one part of the city to the other, by means of the exhaustion of air from a tube, is familiar to our readers. It appears from a report recently made by the directors of this company, that 120 tons of goods can be transmitted through the tube every hour, at a speed of eighteen miles an hour, and that the cost is less than one penny (two cents) per ton for each mile. They anticipate large dividends from the line when completed to points outside the city.

THE REVOLTING SHIP THEORY is to be reduced to practice. It will be remembered that the invention consists of a ship so constructed as to roll over the surface of the water instead of being forced through it. A company has been formed in Baltimore to test its feasibility.

BRONZING.—The following is a good method of bronzing tin castings: When clean, wash them with a mixture of one part each of sulphate of copper and sulphate of iron in twenty parts of water; dry and wash again with distilled vinegar eleven parts. When dry, polish with colcothar.

COAL OIL is a better substance for preserving potassium and sodium than naphtha. In coal oil sodium keeps its luster for months, while in the purest naphtha it is dimmed in a few days.

Scientific Miscellany.

THE EFFECT OF SUNSHINE ON COMBUSTION.

It has long been a popular notion that sunshine deadens fire. This idea has also been very generally entertained by scientific men as well. Dr. Brewer, of Trinity Hall College, Cambridge, England, in his "Handbook of Science," in speaking of the effect of sunshine upon combustion, by the rarefaction of the atmosphere, adds: "Sunshine produces also some chemical effect upon the air or fuel, detrimental to combustion." This paragraph has also been retained in the American edition of this work, revised and edited by R. E. Peterson, member of the Academy of Natural Sciences, Philadelphia. The first recorded experiments made bearing upon this subject were conducted by Dr. McReever, in 1825. His experiments led him to the conclusion that the popular impression was sustained. He found that a candle would burn away more rapidly in a painted lantern, than in one not painted—both exposed to the direct rays of the sun. He found that it required eleven minutes to burn in the sunshine the same weight of candle that burned in ten minutes in the dark lantern exposed to the same sunshine. Some other experimenters, however, differed with McReever.

In 1856, however, the matter was taken up more elaborately by Prof. Joseph Le Conte, of Columbia, S. C. He arranged a dark room in which he lighted two candles of identical make. Upon the flame only, of one, by the aid of a reflector and burning glass, he concentrated the rays of the sun; the other was suffered to burn without any contact with the sun's rays. The result showed that the effect of the sun's rays, though greatly exaggerated by concentration, did not appreciably affect the consumption of the candle.

At the late meeting of the American Scientific Association at Buffalo, Prof. Horsford, of Cambridge, read a very interesting paper upon this subject, in which he alluded to some experiments and observations of his own, going to substantiate the conclusions of Professor Le Conte, that the sun's rays do not exert any chemical effect on the process of combustion. He explained the apparent effect of Doctor McReever's lantern experiment by the well known power which dark colors have of absorbing radiant heat and converting it into heat of conduction; by which the air in the painted lantern was more heated than the air in the unpainted, whereby the tallow of the candle was warmed toward the process of liquefaction, and the heat of the flame to that extent spared for combustion.

The fact that fires in grates and stoves, which burn briskly in the fore part of the day, slacken during the hours of a warm summer's noon, has long been explained as arising from the mechanical, rather than from the chemical effects, of the sun's rays—the rarefaction of the atmosphere, in consequence of which less oxygen is brought into contact with the combustible body which is being consumed. A fire always burns more freely in a cold, frosty, winter's day than in a warm, thawing day, for the double reason that in the latter case there is less oxygen in a given quantity of air, and more moisture. For the same reason we find the great difference in the draught of our stoves observed in this city, between still foggy days and those accompanied by the brisk, dry winds of our summer months. Iron founders are not unfrequently greatly troubled to make their furnaces work properly in the midday sun of a very warm day. Housewives have often found that stove ovens, which bake well in the morning and afternoon, cannot be made to perform that service at all in the brightness of the noontide sun. A rarefied atmosphere, often rendered still more non-conductive to combustion by an excess of moisture, is the cause of the trouble.

From the above, it will be observed that the popular idea that sunshine exerts a chemical effect upon the process of combustion, is without foundation, in fact; but that the heat of the sun does exert a mechanical effect upon the atmosphere, which deprives combustion of such an amount of oxygen as to produce a very noticeable detrimental interference with that process.

SCIENTIFIC AND MECHANICAL RESEARCH.

The world once laughed at Oersted's electrical experiments, thinking that his little magnets, voltaic pile, bits of copper wire, etc., could never lead to any practical result; yet, from these little trinkets came the wonderful discovery of the electric telegraph. When Prof. Black, of Edinburgh, during his investigations into the abstract nature of caloric, made his discovery of latent heat, not even he, himself, thought it would ever lead to anything of special value; yet it was that very discovery that opened the way for Watt to make his important improvement in the steam engine. To say nothing of the great discovery of photography, and other important developments which have grown out of investigations with regard to light; perhaps the most valuable and promising of all the scientific generalizations of the last two or three decades, are those relating to the *Conservation of Force*—to heat, light, electricity, magnetism, galvanism, etc., and the convertibility of the one into the other. This class of investigations is still in its infancy, and we can as yet see but the bright glimmerings of magnificent results which philosophers confidently anticipate at an early future—results which bid fair to work not only revolutions in the great motive power—steam; but also in the very means employed for producing both it and the light by which we are enabled to continue our avocations after the light of day has declined. People sometimes think that the rapid progress in discovery and inventions of the last century, must produce a dearth in that direction during the coming century. Not so; the discoveries up to the present time, are but the preliminaries which are to serve as hints to guide the philosopher and inventor in the developments of greater wonders than have yet been dreamed of by the most profound of the world's philosophers. Each new discovery helps to others. Whenever a new truth becomes apparent, its ramifications appear inexhaustible. As we continue to explore it, its applications multiply upon every hand, till they seem limitless. Indeed, if the inventor or the scientific inquirer had but one original principle to work from, he never could exhaust it; for it would be found interlinked with the entire Universe.

THE CONDUCTIVE POWER OF MERCURY FOR HEAT.—There are peculiar difficulties in the way of ascertaining accurately the conducting power of mercury for heat; but Professor Gripon, of Lille, seems to have overcome them very successfully, and to have made a determination which may be regarded as very closely approximating to absolute accuracy. It shows the conductivity of mercury for heat to be 407-1,000ths of that of lead. Experiments made after Peclet's method shows that if the conducting power of silver is 100, that of mercury is 3.54. Mercury expands, therefore, the last of the metals, and a little before marble and gas coke. It should be observed, however, that the conducting power of this metal for heat and for electricity are very different, the former being 3.54, the latter 1.80.

CRACKS IN FURNITURE may be advantageously filled by the following composition: Moisten a piece of recently burned lime with enough water to make it fall into powder; mix one part of this slacked lime with two parts of rye flour, and a sufficient quantity of boiled linseed oil to form it into a thick, plastic mass.

A new test for acids and alkalies, called "cyanin," has been discovered by a German chemist. It is an artificial blue, obtained by acting on chinoline with iodide of amylen. Its delicacy as a test for acids and bases is quite marvelous, and far superior to litmus.

Common phosphorous bears, for twenty or thirty seconds without ignition, the action of a radiant heat at a focus where, in the fraction of a second, platinated platinum is raised to a white heat.

It is said that sands which are used as a filter for the purification of water are only effective when they contain the black oxyd of iron or magnetic carbide.

[From the Mercantile Gazette and Prices Current.]
QUARTERLY MINING REVIEW.

At no time, perhaps, have mining interests and operations on this coast been in a more healthy and generally satisfactory condition than at the present, whether we consider their actual or prospective productiveness. The yield of the placers during the past quarter has equalled, if not exceeded, the average for corresponding periods of late years. The mountain spring rains greatly benefited such claims as are mainly dependent on this source for their water supply, filling at the same time the ditches, streams, and artificial reservoirs that furnish this necessary element throughout the dry season, and upon which a still larger and more important class of claims is dependent. A number of improvements of this kind, some of them of a very permanent and expensive character, have been completed the past summer. The employment of iron pipes of large dimensions constitutes a new and valuable feature in this system of aqueducts, since they serve to carry the water to points inaccessible by the modes formerly in use. Some of these pipes have a diameter of nearly three feet, and stretching across valleys convey the water from one mountain side to another, furnishing to large communities of miners a constant and copious supply, and securing such a head as is most desirable in hydraulic diggings. Through the agency of these pipes the cost of building ditches has been materially reduced, the construction of lofty and expensive flumes being thus avoided, while water has been furnished in greater abundance and at less price to the consumer. In these massive and costly works, scattered all over the mining regions of California, and constructed for the most part by local capital and the labor of the miner, we find evidences of not only the skill, energy, and perseverance of this class of citizens, but also of their confidence in the mineral resources of the country. In view of the many economies that have been effected in this branch of mining, it seems probable that it will not only maintain its present yield, but that it will steadily continue to enlarge the same, as it has done for several years past. Nor is it to be presumed that these improved modes and labor-saving devices will stop where they are, but rather that these agencies will be multiplied in future, even as new discoveries will continue to be made in the mines themselves.

The history of mining upon this coast has been one of steady and rapid progress. From the time operations were carried on with the pan and rocker to the present day there has been a persistent advancement, until these simple implements and modes have been superseded by others not a little complicated, and demanding a considerable amount of skill and capital for the successful prosecution of the business as now carried on. But with these new demands have come corresponding benefits, by means of which the gross products of the placers has been kept up to its present high standard and the individual earnings of the miner maintained at rates scarcely below what they were ten years ago, notwithstanding the rapid exhaustion of the more superficial deposits so easily reached and so readily disposed of in the earlier stages of mining in California. Through these same instrumentalities vast quantities of auriferous earth, formerly deemed worthless, are now being wrought with profit, while in many places abandoned claims have been reoccupied, and from the refuse dirt and tailings of other days excellent wages have been realized. In view of all this it may well be conjectured that much mining ground, too poor to pay by the methods now in vogue, will yet be made to yield remunerative profits through the introduction of more efficient machinery and economical modes of working.

With an increased activity and fair returns in the older placers, surface diggings, in some instances of considerable extent and apparent richness, continue to be found outside their limits; and, although few of these have as yet proved prolific, they serve to indicate a wide distribution for the auriferous deposits of California, and open a possible chance for a further expansion of her productive gold fields. Among these outside localities, Mendocino county holds a prominent place—surface diggings on quite an extended scale having recently been found within its limits, much of which it is thought could be rendered steadily remunerative with an ample supply of water, and can now be worked to advantage during the rainy season. The site of these diggings is situated wholly to the westward of the Coast Range, and in a country not heretofore considered gold-bearing.

In glancing cursorily at the results of placer mining during the past quarter, we find—beginning in the northern part of our territory—that the mines on the upper Columbia, about Colville and Big Bend, have not turned out according to the expectations entertained of them last spring. While a few have done well, most of the adventures to that remote region have accomplished but little—many, discouraged by the great cost of living and the limited extent of the mines, having left early in the season. In Eastern Oregon and Idaho some few additional discoveries have been made the past summer, while several of the old locations have turned out well. Hill diggings, reported to be rich, have been struck in Boise county, Idaho, and a number of companies, both there and elsewhere in the Territory, have been washing out large quantities of dust. But the principal wealth of that whole region is lodged in the quartz mines, which are unquestionably rich and numerous—the facilities for opening them and reducing the rock being at the same time very great. From Klamath, Siskiyou, Trinity and Shasta counties, covering the more northerly gold districts of our own State, the accounts are as a general thing favorable, and in many cases highly flattering. Much activity prevails throughout that section, labor being in demand and population on the increase, and it seems probable that there is not at present a more inviting field than this open to mining enterprise in any part of the State. The country is, moreover, healthy and well supplied with timber and water, containing at the same time a large extent of virgin mining ground wholly unoccupied and but little prospected. It is, however, somewhat difficult of access, contains but little agricultural land, has deep snows on the mountains, and possesses a cold and rigorous climate in the winter. Along the more central and southern portions of the great gold-bearing belt of California, the labors of the placer miner have in like manner been generally well rewarded, warranting the inference that the aggregate annual product from this source—though less now than in the early days of mining—is on the increase, and that this increment will be still more marked in the future than it has been for the past few years.

While lack of space precludes our citing individual examples of success in this department of mining, we may say the greatest gains seem to have been made in the river bed, hydraulic, cement and gravel branches of the business. The first of these, in consequence of the heavy disasters that have so often attended it, had come to be nearly abandoned. But, profiting by past experience, most of these enterprises have this year been crowned with algal success, some of them having secured large sums with a comparatively trifling expenditure of capital and labor. Many of the hydraulic companies have also cleaned up immense quantities of dust; the cement and gravel claims having in the aggregate done equally well. These latter, it has recently been determined, have a greater value as well as a far wider scope than was

formerly supposed, and already the theatre of very extended active operations, they promise to become ultimately one of the most lucrative and lasting sources of our mineral wealth. In the progress of their development numerous costly shafts and tunnels and other underground works of an expensive and elaborate kind have been completed, while still others of equal or even greater magnitude have been entered upon or projected. From much of this cement the gold can be released only by the process of pulverization; hence many stamping mills have recently been erected for the purpose of crushing and working it after the manner of auriferous quartz. Many of these mills are of large capacity, carrying from ten to forty stamps, each of which are capable of crushing two tons of cement per day. Portions of this material are very rich in free gold, besides containing much combined with sulphurets. Worked in the mills the yield ranges from \$30 to \$50 per ton, a great deal of it turning out a much larger amount. In this estimate the sulphureted ores, often the richest part, are not included. From the gravel, as well as the less indurated portions of the cement, the gold is extracted by sluice washing, the results frequently being large and occasionally enormous. The product of some of these claims averages more than a thousand dollars per day for months in succession. The preliminary outlay, however, in bringing them to a productive stage is often very heavy. Some of the tunnels leading to these cement and gravel deposits have required six or eight years of constant labor for their excavation, the attendant expense amounting in many instances to more than a hundred thousand dollars. An outlay of twenty or thirty, and even fifty or sixty thousand dollars, in the prosecution of these works is of common occurrence, while it must not be overlooked that many of them when completed barely defray the current expense of working, or result in total failure. Taken as a whole, however, they may be considered a successful branch of mining, and as a consequence are growing rapidly in favor with both moneyed men and practical miners. Looking over the whole field of placer mining, as exhibited upon this coast for the past three months, the business may justly be accounted to have been at least moderately prosperous, a condition that there is every reason to believe it will be able to maintain in the future.

QUARTZ MINING.

While, as we have seen, the placers of California are far from being exhausted; and while the past season has been every way auspicious in this department of mining, still, the foundations of her greatest mineral opulence and most enduring wealth, will be found to lie in her veins of auriferous quartz, the business of reducing which, although already expanded into magnificent proportions, is insignificant compared with what it will hereafter become. How extensive the area of these quartz mines may be or with what profit they can eventually be worked, are questions of time, enough having been determined to prove the former almost coextensive with our Pacific possessions, and to demonstrate that the probable limit to this branch of mining will be conditioned upon the amount of capital that may hereafter be embarked in its prosecution.

Of the early history of the business in this State—of its struggles and failures, relieved by but few cases of success—it is not our purpose at this time to speak. Enough that the pursuit has survived these disasters and is to-day on a firm and prosperous footing, with very little to cause apprehensions for its future. That there will continue to be cases of failure and loss hereafter, as there have heretofore been, in the prosecution of this business, must be expected. In every calling parties will be found unwilling to comply with the most obvious requirements to success even when well understood. Incapacity, cupidity, folly and fraud, cannot be wholly guarded against. The infirmities of human nature will display themselves in quartz mining as well as in every other pursuit. There being, moreover, other causes of failure and agents of defeat inherent in this business, and which will often frustrate the best devised plans and carefully executed operations. It is not to be denied that with all the improvements made and knowledge gained this branch of mining is in many instances still attended with trouble and uncertainty; though not with more, perhaps, than is incident to most other pursuits in their earlier stages, especially when undertaken in a new country. However this may be, one thing is certain, the business as a general thing is now being made to pay and in many cases very largely. Where entered upon with judgment and conducted with prudence the examples of failure have been comparatively few for several years past, and with increasing experience it is but reasonable to infer that the chances for success will be all the while improving.

There are also other points of view from which this business presents a more cheering aspect than formerly. The spirit of speculation, long so rife, and in which most of the mistakes and follies that proved so disastrous had their origin, has about subsided, having given place to more practical and sensible ideas and modes of procedure. The expensive and vexatious litigation that hung over so many claims, alarming capitalists more than all other causes combined, has been pretty well disposed of. The day of useless and extravagant expenditure, as well as extravagant expectation, is also well nigh over. In embarking in quartz mining and mining something of the economy and discretion manifested in other affairs is exhibited, and certain rather than excessively large returns are looked for. With these wise changes have of course come better results. Success has taken the place of failure, and profit has pretty generally been substituted for loss. In fact these reforms have led to such advancement in practical operations that quartz can now be worked with gain that the millman could not a few years ago afford to pass through his batteries for all it contained. Thousands of tons of rock are now being worked with profit that would not then pay cost of hauling from the mine to the mill. Five and six dollar rock, in favorable localities, is now considered a very good thing; whereas the mining enterprises first initiated were based upon the supposition that the quartz would pay from forty to sixty dollars per ton, many of the estimates designed as the basis of business operations being much higher. With water power and favorable surroundings money can now be made crushing quartz from which not more than four dollars per ton can be extracted. The average cost of crushing and amalgamating in this State is now about two dollars per ton—some mills performing these operations for less than one dollar. In Idaho and other localities in the remote interior the cost is somewhat greater. This is for ordinary quartz treated simply by the gold-saving process. The reduction of extremely rich gold-bearing rock and silver ores is attended with much greater expense. The cost of mining and working the common grade silver ores at Virginia City, Nevada—which constitutes the great bulk sent to the mills—is about fifteen dollars per ton each, making a total of thirty dollars. The average yield of these ores is forty-four dollars per ton, giving a clear profit of fourteen dollars on every ton of ore worked. But it must be remembered that the sums spent upon these mines in their development, the erection of mills and for various other purposes are very large, amounting in some cases to several millions of dollars. The business of silver mining in that State having been in a good measure purged of the abuses that for a period greatly retarded and

even threatened to seriously cripple it, is now being carried on with more satisfactory results; the yield of bullion for the present promising to equal that of any former year, the cost of its production having meantime been considerably curtailed. In view of the extent of her mines and the large amount of capital now being applied to their development, this staple of Nevada will no doubt be vastly augmented within the next few years.

NEW AND IMPORTANT MINERAL DISCOVERIES.

Among recent mineral discoveries meriting attention is that of a metalliferous mass, near the town of Lincoln, Placer Co., consisting of large quantities of iron pyrites and several varieties of copper ore, imbedded in taceous slate, the whole carrying such a notable per centage of gold as to warrant its being worked for this metal alone, though there is an absence of any well defined vein of quartz. This metalliferous group lies in a small hill, from the sides of which the slate outcrops for a width of two hundred feet, the work of exploration being carried on by means of an open cut after the manner of a quarry. The entire body of this material is soft and chertous and is so easily pulverized that a five-stamp mill now running upon it is capable of crushing forty tons per day. It yields by the present imperfect mode of working from five to six dollars per ton, an amount which it is thought might be nearly doubled by a more effectual style of treatment. This property, having lately passed into the hands of a company possessed of ample means, is to be at once made available to its fullest capacity—a 40-stamp steam mill designed to work the rock now being in course of construction. The discovery of this deposit, or rather the turning of it to immediate practical account, the actual finding having transpired some two years ago, is to be looked upon as an event of no little importance, there being doubtless others of a like kind elsewhere in the State, the speedy development of which may be anticipated in view of the success that is likely to attend this pioneer effort at what may justly be denominated gold quarrying. In fact, deposits closely resembling that above alluded to have already been found at points known as Quail Hill, and also at Rich Guleb in the County of Calaveras. These mines have lately been sold for large sums to capitalists in this city, who intend proceeding at once to build mills for working them on a very extensive scale, it being the opinion for both scientific and practical men, many of whom have carefully examined them, that they will prove the most easily worked and lucrative mines in the State. The peculiar value of these remarkable deposits consists in the abundance of material, the slight cost at which it can be taken from the mine, and the facility with which it can be crushed, the entire expense of these operations being so trifling that it is estimated that rock which will pay no more than one dollar to the ton can be worked with profit. This, it will be remembered, is a gain upon even the extraordinary cheapness with which ores are represented to have been worked in Australia, the announcement of which caused no little wonderment in mining circles when made here a short time since. The rock operated upon in that colony was undoubtedly of a like soft character with this found near Lincoln and in Calaveras County, a fact that readily reconciles us to accept that statement as true.

COPPER, COAL, IRON, ETC.

Besides the precious metals so profusely scattered over our Pacific possessions, they are equally prolific in almost every species of useful metal, as well as a great variety of mineral substances largely demanded for use in the manufacturing arts, commerce, mining, and almost every other industrial pursuit. Of copper ores California is annually sending abroad ship loads, extracted from her rich and extensive veins only a small per centage of which have yet been developed to a productive stage. Very promising deposits of Coal, of an excellent quality, have been found in various parts of the State, and from the flattering success attending the working of the Mount Diablo mines, the only ones yet opened to any extent, there is reason to hope that we shall be able in a few years to extract from our own soil a sufficiency of this fuel to meet every home requirement. Our Quicksilver mines, noted throughout the world, have long been turning out enough of this metal to supply the large home consumption with a heavy surplus for exportation. The New Almaden, our principal mine, is now in a flourishing condition, while a number of other deposits, situated in different parts of the country, are beginning to yield considerable amounts of metal, with every prospect of being able to speedily enlarge the same.

Of Iron ores we have unlimited quantities, and of superior quality—some of it assaying 90 per cent. of metal, and being adapted to produce the best of steel. Works on a limited scale have been erected in this city to test portions of these ores, which, if the experiment is encouraging, will probably lead to attempts at manufacturing on a large scale. Borax, Salt, Lead, Manganese, Sulphur, Nitre and various other minerals, and a host of other mineral and metallic substances of home production—a list that will no doubt soon be made to embrace a large number of other articles, inasmuch as nature has supplied us with the crude material in the greatest variety and abundance. Already we are manufacturing from these salts a sufficiency of such acids as are required in the reduction of ores and the refining of metals to meet domestic requirements—the home-made article, besides being cheaper, being preferred to that formerly supplied from abroad.

ESTABLISHED [MAY, 1860.]

VOLUME THIRTEEN

—OF THE—
Mining and Scientific Press,
 COMMENCING JULY, 1866.

DEWEY & CO., Publishers.

Issued every SATURDAY, at our Book and Job Printing Office, 505 Clay street, corner of Sansome, San Francisco.
Terms in Advance—One year, \$5; Six months, \$3; Single copies, 15 cents; Monthly Series, \$5.50 per year, or 45 cents per number. Back Volumes from January, 1864, \$3 per volume; bound, \$5 per volume.

The Mining and Scientific Press is now thoroughly established, and enjoys one of the largest and most permanent subscription lists of any weekly journal on this coast. The individual character and reputation of its constant patrons throughout the entire coast is one of the best recommendations of its merit and value as a medium of intelligent progress and prosperity.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, October 13th, 1866.

In City Stocks little has been doing for some time past. During the week just closed most of the insurance companies declared their usual quarterly dividends, which we enumerate more in detail below.

At the annual meeting of the Home Mutual Insurance Co., held on the 10th inst., Henry C. Lee was elected Vice President in place of J. G. Jackson, resigned. This was the only change made in the old Board. The assets on Oct. 10th were reported at \$354,000; on Dec. 31, 1865, they were \$226,000, showing an increase of \$128,000. Fire Risks written up during this year amount to \$1,786,000; Marine, \$234,000. Risks in force at this date, \$1,162,000. The stock of this Company has been changed from \$1,000 to \$100 per share.

The Pacific Insurance Company paid a dividend yesterday of 6 $\frac{1}{2}$ cent. for the quarter ending Sept. 30th. This stock we quote at \$174 asked. California Insurance Co. also declared 6 $\frac{1}{2}$ cent., payable on the 15th. San Francisco Ins. Co. declared 4 $\frac{1}{2}$ $\frac{1}{2}$ cent. for the quarter. Cal. Home Ins. Co., we understand, has declared 3 $\frac{1}{2}$ cent. for the quarter, payable on and after the 12th inst. The San Francisco and Oakland R. R. declared a dividend of $\frac{1}{2}$ $\frac{1}{2}$ cent. on their capital stock, payable on the 15th inst. During the week, California Steam Navigation Co. sold at 72@71 $\frac{1}{2}$ $\frac{1}{2}$ cent. We quote it at 71 $\frac{1}{2}$ cent. at the close. Spring Valley W. W. Co. was sold during the week at 58 $\frac{1}{2}$ $\frac{1}{2}$ cent.

Some \$12,000 of U. S. 7-10 June Bonds were sold within a range of 76@75¾c during the week. Legal Tenders to the amount of \$70,000 changed hands at 71¼@70¾c.

From a carefully compiled record of the sales in the San Francisco Stock and Exchange Board, we give the following very interesting figures, extending over a period of two years and nine months:

	MON. A.	1864.	1865.	1866.
January.		\$3,484,284 75	\$1,901,598 75	\$2,327,137 00
February.		2,726,420 50	2,358,556 00	3,752,232 00
March.		2,976,792 00	2,582,525 00	5,882,275 00
April.		2,619,072 00	4,339,032 00	4,038,096 00
May.		1,688,285 00	5,635,649 00	3,452,102 00
June.		2,617,000 00	4,771,640 00	2,406,311 00
July.		1,397,537 50	7,742,233 00	1,553,873 00
August.		839,062 75	4,231,018 00	1,284,451 75
September.		1,235,390 75	4,839,591 00	1,738,190 75
October.		1,957,500 00	4,360,530 00	
November.		1,681,152 25	3,051,996 00	
December.		2,372,465 25	4,777,437 00	
Totals.		\$25,832,715 00	\$39,205,819 75	\$25,871,618 75

During the year 1864 the transactions were principally confined to Mining Stocks. This has not been the case in 1865 and 1866; while the Mining Stock sales have decreased very materially. City Stocks, Government Bonds, Legal Tender Notes, etc., have been quite largely dealt in, and the business in these securities is gradually augmenting and becoming more and more the basis of brokerage operations. The large increase of nearly \$24,000,000 in the sales of 1865 as against those of 1864, may be attributed mainly to the sale of Bonds, etc., in connection with Mining Stocks. It will also be noticed that the sales of the nine months of the present year sum up more than the entire year of 1864—showing an increased business for 1866 from other than Mining Stock sales.

Sales of Mining Shares during the past week have taken a wider range than for some time past, the stocks of some twenty different companies having been dealt in. Both the Hale & Norcross and Savags companies have increased their dividends this month, respectively declaring \$100 and \$75 per foot. A healthier period in mining stocks seems to be approaching, and we have encouraging information from various quarters.

The receipts of Bullion by the following prominent companies during the period under review, we have collected from official sources.

1 shs Empire M & M Co. at 75 per share.

giving also in this connection a full summary of the number of tons of ore from which the several amounts have been produced :

COMPANY.	July.	August.	September.	Total.	Tons Ore Reduced.
Hale & Norcross.....	\$158,898 00	\$118,000 00	\$150,719 49	\$408,602 49	8,236
Yellow Jacket.....	174,708 00	379,690 92	259,690 78	\$814,090 70	26,860
Savage.....	2,500 00	1,400 00	1,400 00	\$5,300 00	10,200
Gould & Curry.....	158,700 00	134,395 23	177,821 35	\$470,916 58	12,800
Grain Point.....	36,567 00	69,431 00	120,000 00	\$325,000 00	6,325
Imperial.....	68,418 16	76,840 22	76,459 67	\$221,718 05	10,200
Chollar-Potosi.....	72,000 00	67,000 00	63,000 00	\$202,000 00	8,342
Empire Mills & M. Co.	28,440 76	31,520 25	41,813 15	\$101,774 16	4,421
Total.....	\$838,924 92	\$1,031,967 02	\$969,380 64	\$3,840,282 58	88,597

This total of the above number of tons of ores reduced by the eight companies represented in the tables, shows an average of \$33.72 per ton.

Hals & Norcross continues to keep out of the market, being still held in firm hands. We may nominally quote it at \$1,800. Deducting the dividend of \$100 per foot (\$40,000), payable on the 15th inst., we understand that a surplus of more than \$100,000 remains at the credit of the company. The September yield of bullion is largely in excess of either July or August. The average yield from ore reduced during the months of July, August and September, was a trifle over \$49 per ton.

Yellow Jacket fluctuated from \$740 to \$705 (ex-dividend), and at the close sold at \$715. During the month of September, 8,431 tons of ore were reduced. The average yield per ton for the past three months has been nearly \$36. After paying a dividend of \$50 per foot on the 15th inst., a balance of some \$120,000 will remain on hand, according to the statements of the company.

Savage sold at \$1,130 early in the week, advanced to \$1,175, then sold at \$1,135 (ex-dividend), and closed at \$1,195, b. 5. The ore now extracted from this mine averages, it is said, \$58 per ton for second-class and \$30 for third-class. During the week ending October 6th, 1,234 tons of ore were mined, and the profits during the same period are estimated at \$21,240. A dividend of \$75 per foot has been paid for the month of September. During last month, 3,500 tons of ore were reduced, giving an average of more than \$41 per ton.

Gould & Curry has changed bands during the past week at \$550@555, closing at \$590 asked. The new body of ore, said to be of good quality, is located about 500 feet southwest of the Bonner shaft, and 40 feet below the second level. It is the same spot passed through some time ago in sinking the incline from the second to the third level, below the lower tunnel.

Crown Point was sold at \$920 early in the week, and at the close we quote it at \$925, s. 30. During the week ending October 6th, 614 tons of ore were extracted from the mine. The lower level is now free from water. The east body, in the 400-foot station, it is said, discloses a lode of good ore some 6 feet in width. The average yield of ore for the month of September was \$38.48 per ton.

Imperial opened at \$84, declined to \$79, then sold at \$80, and closed yesterday at \$75. During the month of September, 3,384 tons of ore were reduced. Chollar-Potosi steadily receded from \$115 to \$112.50, then sold at \$107.50, and closed yesterday at \$108. The average yield of bullion for the quarter closing with September was a little more than \$23 per ton. Empire Mill & Mining Co. opened at \$70, then sold at \$80, buyer 10. During the months of July, August and September the receipts of hollion averaged about \$23 to the ton. A dividend of \$6 per share was paid on the 10th inst. It is said that the future prospects of this company are much more encouraging. Ophir opened at \$195, buyer 30, declined to \$165, seller 30, then sold at \$180@177, and closed at \$170.

Belcher changed hands during the week at \$92.50@77. Bullion declined from \$14 to \$8. Alpha sold at \$70 per foot. Confidence sold at \$56@50. Overman opened at \$17, and at the close sold for \$11. Daney commanded \$5.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday, amounted to \$297,305.75.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County—

From the *Miner* of Oct. 6th: The George Washington ledge widens and becomes more distinctly defined, as they advance. The ore now being taken out closely resembles that from the Mexican mine, Virginia City. The contractor for hauling the 10,000 tons of Morning Star ore to the mill has been notified to commence delivering immediately, and the first load goes to the Davidson mill to day. The Schenectady Silver Mining Company during the two weeks they have been at work have made over forty feet of tunnel, $5\frac{1}{2}$ by $6\frac{1}{2}$, penetrating the celebrated Tarshish ground on Monitor Mountain.

Amador County—

From the *Ledger* of 6th Oct.: Pangh has put a splendid new engine in the Rocky Falls mill, and is now engaged in working up a lot of (300 tons) rock that has accumulated since the mill went into his hands. The prospects continue as fair as ever. The Anaconda give no sign of "weakening." A few days since, the boys pounded out 150 pounds of rock that paid a dollar to the pound. The Golden Eagle, Vaughn, Perry & Co., is still turning out splendid ore. The Mahoney, at Sutter, is yielding ore rich as ever. Late improvements have been completed. The Kenedy Company purpose erecting a large steam mill. Tanner, Serine and Payne, after a summer's campaign in search of the south extension of the Eureka, at Sutter, think they have at last found it. We still hear most encouraging reports from the Newton copper mine. The new vein of ore found some weeks ago, still continues as rich as at first.

Butte County—

From the *Record*: Mr. Armstrong, of the Buffalo Ranch, has shown us some very fine quartz specimens, taken from a ledge about four miles from the ranch, and near the Unconditional Union Quartz Company's claim. The free gold exudes from the white quartz in globules, as if the ledge were perspiring the precious metal. We understand that Mr. Armstrong intends taking measures to develop the extent and richness of the ledge, with a view to working it.

Calaveras County—

A letter from Angels to the Marysville *Appeal* says: The mother lead of the district averages ten feet in thickness. In the Sticks' mine, at a depth of one hundred feet, it is twenty-five feet wide; in the Hill mine it is about the same width; in the Winter's mine it is about the same. A fine 30-stamp mill is now in course of erection on the Hill mine. On the Sticks' mine is a 10-stamp mill, and on three other mines, three other mills, all in operation. There is but very little difference between these mines and the great Hayward, in Amador, which is said to be upon the same lead. Angels is emerging from the obscurity to which bad management consigned her.

El Dorado County—

From the *Placerville Record*, Oct. 6th: The mining prospects about Georgetown are generally good. The Woodside Company are down on their ledge 100 feet, and are taking out rock of the richest character. The Collins extension company have excellent prospects, and are vigorously pushing on the work of prospecting. The Neptune Company, at Volcanoville, have a ledge about twenty inches wide, and have crushed the rock from the top down to a depth of ten feet. The yield from the rock has been \$100 per ton, and this without selecting it at all, but taking it as it comes.

Fresno County—

From the *Mariposa Gazette*, Oct. 6th: Capital is gradually working its way into Fresno county, and the innumerable partially developed quartz veins in that section are likely to be brought to the notice of moneyed men. The country about the Fresno is comparatively new, and very little quartz mining has been carried on. Some very good discoveries have been made lately by parties from San Francisco, which it is hoped will give an impetus to quartz operations in that part of the country.

Kern County—

From the *Havilah Courier* of October 6th: Lovely Rogers, Hamp, Williams & Co., have discovered an exceedingly rich quartz lode on the Keysville side of Kern River. We have been shown some of the rock, which is thickly interspersed with gold, visible to the eye. The rock also contains a considerable percentage of silver. The ledge is about three feet wide, and is seven miles below Keysville. The Alpine Gold Mining company, with a capital stock of \$10,000, for the purpose of working fifty-three quartz lodes in the Green Mountain district (formerly Greenhorn), was incorporated September 29th. Trustees: Wm. F. White, Geo. S. Wright, and B. W. Mudge.

Nevada County—

From the *Gazette* of October 2d: The Eureka mine cleaned up, for the last twelve days' run, between twenty-five and twenty-six thousand dollars. The cement mining interest of this county is located principally in Little York township. There are twenty-one cement mills in the county, having an aggregate of 173 stamps, of which sixteen mills, with 134 stamps, are in Little York. There is one cement mill in Nevada township, two in Washington, one in Bridgeport, and one in Grass Valley.

Oct. 5th: J. E. Squire, superintendent of the U. S. Grant mine, arrived in town on Wednesday, bringing a bar of gold worth \$2,758, the yield of fifty-five tons of rock from the mine. This is the first run on ore from the Grant mine since the company purchased the mill of Parsons & Co. The company will immediately increase the capacity of their mill by taking out the 300-pound stamp and putting in stamps weighing 700 pounds.

Oct. 6th: The quartz mill erected by R. C. Black on the Young ledge, in Eureka township, was started up last Thursday and found to work admirably. The mill has ten stamps, is run by a 35-horse power engine, and is a substantial structure. It is called the Glenbrook mill. The incline on the Monadnock ledge is now down about eighty feet. The rock looks well, and the ledge is of fair size. A lot of about ninety tons of rock from the Willow Valley company's ledge was crushed at the Oriental mill last week, and yielded twenty-five dollars a ton. This company now employ thirty hands, and the mine has yielded between three and four hundred tons of rock since the hoisting works were completed. We learn that quartz prospecting is now going on very extensively on both sides of Bear River, near the Colfax road. The celebrated Bankermine has been traced south as far as Saunders' ranch, where works are being erected to reduce the ore. This is ten miles south of the claim of Harpending, and parties are endeavoring to trace the ledge north into Nevada county.

From the *National*: The quartz mines in the vicinity of Newtown are beginning to attract attention, and the district promises to become one of the best in the county. Several San Francisco capitalists have become interested in the district, who are spending their money liberally, and machinery will probably be placed on some of the mines in a short time.

We were shown, to-day, a piece of rock weighing thirty-four and a half pounds, taken from the Mary Etta ledge, which was literally permeated with gold, and we are informed that this is a fair sample of the whole ledge, so far as prospected, which is from three to six feet wide. The ledge was located about six weeks since, and the shaft is now down only some thirty-five feet. Some seventy-five tons of rock have been taken out, in every particle of which gold is plainly visible. The ledge is owned by Colbert, Spring & Co., and is located on Diamond Creek, four miles above Omega, and about twenty-eight miles due east from Grass Valley.

EXCELSIOR.—From the *Meadow Lake Sun*: The Mohawk and Montreal company have struck their ledge on the lower level, and find it to be, as far as penetrated, eighteen inches wide and of excellent quality. The Idaho and Imperial company have a fine, large shaft, six by eight feet, and twenty-three feet deep, on their ledge. The rock, some forty or fifty tons of which have been selected for crushing, is not inferior to the Excelsior, which it closely resembles. We learn from Mr. J. Hill that a fine vein of copper has been struck at a point on the river, not far from Old Man Mountain.

The new Excelsior mill started up on the 29th of September. Everything worked well, with a few trifling exceptions, which can be easily remedied. The Webster company, on the Danville ledge, has sunk a shaft about fourteen feet deep on the ledge, and is taking out gray sulphuretted ore, which would pay, judging by assays, immensely rich returns. The stratum composed of this character of ore is between four and five feet in width. The Camp company, Shooting Star ledge, commenced work on the 13th of last July. They now have a shaft, twelve by eight feet, down thirty-eight feet. At this depth the ledge is well defined, and about four feet wide. Assays from the rock show—gold, \$623.24; silver, \$46.10; and fifteen per cent. copper. Five tons of rock and dust, taken from the surface of the Moscow company's claim, paid in free gold \$82. A new claim has been discovered and located in the last week, situated on a ledge between the Pacific and Excelsior. We have seen specimens from the claim studded with gold. The company takes the name of the White Cloud. C. C. Whitehead has made a contract with the Empire company to sink a shaft fifty feet before February 1st, for no other compensation than the ore taken out. He has the privilege of twenty-five feet in addition to this.

Editorials in same paper speak hopefully and even exultingly. They insist that the district has something to show for its summer's work. We quote: "We have built up a sub-

stantial and handsome town, and paid for it. We have opened three excellent roads to connect with the great thoroughfares of travel; we have constructed six good mills, and now have a power in the district of not less than fifty-eight stamps. Finally, we have developed a large number of mines, whose richness is admitted by every one that has visited and inspected the district. Business must revive, and we have the certainty of a prosperous future."

The same paper furnishes a table showing the amount of bullion shipped from the mines of that district during the month of September, viz.:

Western Co.	\$ 176 37
Kuickerbocker Co.	34 10
Mohawk and Montreal Co.	108 85
Enterprise Co. and Montreal Co.	1,250 00
Mohawk and Montreal Co.	2,250 00
Alhambra Co.	250 00
Moscow Co.	82 00
Total	\$4,121 32

Placer County—

From the *Stars and Stripes*, Oct. 3d: W. J. Taylor is sinking a shaft on the Davenport, between two swells of the ledge. At the depth of twenty feet he finds the vein nine inches thick, and the quartz of an excellent quality. Four hundred feet of this ledge were sold recently for \$2,000. Work is progressing on the Poland ledge, and the appearance of the rock is very promising. We understand that parties in Sacramento have agreed to erect a mill on this ledge whenever it is sufficiently developed to warrant the outlay.

Oct. 10th: The Mattheson claim, near Bald Hill, has acquired a wide-spread reputation for richness, and is said to present all the indications of a first-class mine. While out prospecting for the extension of the Mattheson lead, Mr. Wm. Bissett and others struck a small but rich ledge which they have named the Woodstock. Messrs. Millette & Havey are running their mill on rock from their ledge in Baltimore Ravine, and though their machinery is out of the best, they get paying results.

Plumas County—

From the *National* Sept. 29th: "Mr. Wm. Jacks, of Gopher Hill, has cleaned up and received \$10 per day to the hand after paying all expenses. Squire Jacks, \$8 per day. Reynolds has done well and sold out. Esq. Metcalf is still drifting—has no water to clean up, but expects to do well. Simpson, Acres & Co. on the creek, near Boston, have a number one claim, but with their present facilities can make but little wages. If well rigged they could make from one ounce to two per day. Scotty, at the mouth of Snake Lake creek, is doing very well. Ned. Evans is after it as usual in the creek above New Boston. John Wilson & Co. at Silver creek is doing well, and so is Sam Carr, at Meadow Valley. The boys in Eagle gulch are slack of water, but still hold on to the old ground. Rich Bar, Twelve Mile Bar, Ding Bat Flat and Rich Gulch, are yet very fairly represented in the gold market. Rush creek still turns out, with the labor done on it, a nice amount of gold dust. The Bull-Frog diggings are turning out well. Geise & Bennett are making their \$10 per day. Soda Bar is not behind in her endeavor to raise the color if hard labor will do it. In fact, all of the "played out" diggings are in demand by the bone and sinew of our land, who are just returning from some of the bug-a-hoo excitements."

From the *Union* of same date: Morris & Co.'s river claim, on the North Fork, is paying an ounce per day to the hand regularly, and on Saturday last the company took out forty ounces for that day's work. J. S. Carter has sold his interest in the Plumas ledge in Indian Valley, to one of the other owners in the claim, for \$9,000. The ledge is being worked and is paying well. The New York Company at Sawpit, are taking out some rich pay dirt. The American Company, on the Dixon side of Washington Hill, struck pay grit last spring, and are still taking out good looking dirt. The Buckeye Company, on the same side, are still pegging away at their tunnel.

Sacramento County—

From the *Folsom Telegraph*, Oct. 6th: A cement claim on Maine Flat, immediately opposite Folsom, is being worked by Fischer & Co. The cement is worked with an arastra, and is paying well; pieces of the cement can be seen thickly studded with gold. We understand the company intend shortly to erect a mill.

Shasta County—

From the *Courier* of Oct. 6th: Wm. Logan, James Burgoon and Charles Williams are now working the richest claim ever found in the Pittsburg district. It is in Squaw Creek above Crocker's mill, and the ground on the bed rock pays from \$1 to \$2.50 to the pan. Considerable activity is being manifested by the miners in the vicinity of Churntown and Buckeye, in making preparations for mining the coming winter. The width of the Potosi at the present depth of ninety feet, is two feet. The rock improves in quality. It is reported that a San Francisco company have

purchased the original Chicago mine, on the South Fork, for \$50,000. The workmen on the Chicago lode are taking out some very rich gold and silver rock. Some estimate its value at \$600 to the ton. We understand that the owners of the Union lode have concluded not to do any more work on it at present, and offer their mill for sale at a low figure. The Mammoth Company made a short run last week, and cleaned up four hundred dollars. The workmen are still hammering away in the William & Kellinger claim, and are running a branch tunnel in the direction of the Baxter claim.

Sierra County—

From the *Messenger* of Oct. 6th: The Keystone cleaned up about ten days since, after a run of five weeks, and took out the sum of \$10,500.

Letter from St. Mary's District says: After a year's work, the General Grant has "struck the ledge" at a depth of seventy-five feet in the shaft, and a drift of about one hundred and fifty feet. The pay streak is about three to four feet wide where it was first struck, and is widening out. Three assays have been made, resulting as follows: 1st, the casing, \$43 17; 2d, Grant ore, \$54 63; 3d, the best rock, \$84 51; silver ore largely predominating. There is considerable excitement here; some ten or fifteen locations have been made during the past two days. Our town site has been laid out, and we are expecting business in earnest.

A letter from Howland Flat says: The Pittsburg Co. have lately put in a new water wheel. The claim is paying, as of old, very well. The Mammoth have not as yet commenced taking out pay. The Hawkeye Co. are jogging along, making something more than wages and expenses. The Union, Down East, Sbirly, Lone Star, Sugar Loaf, etc., never fail when Saturday night comes round to deposit their usual amount of dust. The Mountaineer was closed up by the Sheriff a few days ago, but will soon be at work again.

Siskiyou County—

From the *Yreka Union* of Oct. 6th: The quartz mining business in this county has received a new impetus. A number of companies have renewed operations, and parties from San Francisco are here now making arrangements for the immediate erection of a large mill on Humbug. The Steam Engine Company has resumed work, and we understand they are getting fair pay.

Tulare County—

From the *Delta*, Oct. 3d: The mines in the Upper Tulare District promise to be very rich in gold, silver and copper. There are old miners engaged there who are not easily misled. We have been shown by Professor Greeley, who has just returned from the mountains, a splendid specimen of copper ore, given him by an Indian, and taken from the headwaters of King's river. The ore is sprinkled with silver.

Tuolumne County—

The *Columbia Citizen* of the 6th inst. says: Capitalists are looking around in the vicinity with a view of investing in quartz mining. Gen. Rosecrans, in connection with A. Hayward and O. L. Chamberlain, are about to commence with a capital of \$500,000. J. W. Hussey is now in Columbia, with instructions from a New York company to purchase extensively in quartz.

Yuba County—

From the *Marysville Appeal*, October 4th: About 1,500 shares in Templar Mining Company No. 2, located at Indiana Ranch, were sold yesterday afternoon for assessment of \$1 and expenses of sale. The principal purchasers were W. L. Lawrence and S. G. Allen. Templar No. 2 has a first-class mill on it, and the ledge is being prospected very economically. The steam engine used at Brown's Valley on the Dan Webster claim, has been sold to the "Marysville-Nevada Mining Company," and will be shipped for Nevada to-morrow.

NEVADA:

Washoe—

From the *Virginia Union*: The streak of rich ore in the Gould & Curry has widened to two feet. It is of a soft, decomposed nature, rich in silver sulphurets, and will yield \$80 or more to the ton; being more like gravel than rock, it is mined out with the greatest facility, and is sacked up for milling. This rich ore is found about 500 feet southwest of the Bonner shaft, and some 500 feet below the level of D street.

The expense of running the Gould & Curry mill for the month of August was \$36,800; the number of tons of ore crushed was 3,135, at a cost of \$11.73 per ton; the rock assayed \$53.40 per ton; the amount of bullion returned was valued at \$102,506.18. The Savage Mining Company has declared a dividend of \$75 a foot, and carried over quite a surplus towards next month's dividend. The Yellow Jacket declared a dividend of \$50 per foot.

From the *Gold Hill News* of October 1st: There was shipped by Wells, Fargo & Co., from their Gold Hill office, during the month

of August, \$700,940.43. About a hundred thousand dollars of the product of the Gold Hill mines, besides the above, was shipped from Virginia City.

Reese River.

From the *Reveille*: In Northumberland district, forty distinct ledges have been discovered and located, which are generally of large size, and better defined than those of any other district in the region. The Northumberland ledge crops on the surface over 1,100 feet, and in several excavations the vein is twelve feet thick, nine feet of which are well loaded with mineral.

Same of Oct. 1st: Col. Bael brought in from his mill in Philadelphia district on Saturday last, 4,627 ounces of crude bullion, the result of one week's crushing of ore from the High Bridge ledge.

Oct. 2d: Three tons of ore from the Danville district were reduced last week at the Keystone mill, yielding at the rate of \$153 per ton; the bullion was 942 fine. The ore was obtained from the Vanderbilt and Hibernia ledges. In Pulmetto district, quartz has been struck about two miles west of the original locations. Five ledges were located, the two principal of which are called the Double Eagle and the Empire, the former being two and a half feet wide and the latter one foot. The reddish quartz is fairly studded with free gold.

Oct. 3d: A small lot of ore from the Green and Odeur location in the Philadelphia district, was recently brought in and reduced at the Keystone mill, yielding at the rate of \$300 per ton. A 30-pound sample of the Silver Champion ore, Philadelphia district, was brought into town a few days since. An assay was made of a piece broken transversely off the whole mass, which gave the enormous yield of \$8,409 per ton. The owners are now engaged in extracting ore, for the purpose of having it transported to the Keystone mill for reduction, and they are confident of being able to obtain ore in quantities that will work at the mill fully \$600 per ton. The claim of the Silver Champion comprises 1,400 feet, and is owned by J. R. Murphy and Robert Morrill.

Oct. 4th: In the Revelle district, the Antarctic ledge is 56 feet thick; the August, 73; the Crescent, 106; the Mediterranean, 60; the Atlantic, 40; and the Atlantic, 45. Assay of the Atlantic ore gave \$1,658.74 per ton; of the Mediterranean, \$1,361.75.

Editorial of same date reiterates former statements in regard to the extraordinary richness of the new districts. It says: As to proof of these assertions, we only ask the closest examination. We say we offer to the capitalists of the world the finest opportunities for profitable investment of any country or business, and we challenge comparison. The capitalists of San Francisco have treated this section with an indifference which eventually they will regret.

Oct. 5th: Two assays of very choice and carefully selected specimens of ore containing horn and native silver from Revelle district, were made this morning. The specimen of native silver yielded \$27,204.83 of silver per ton, while that of horn silver yielded only \$22,180.93. Nine tons of ore from the Taylor & Passmore claim from the Nevada Giant ledge, Cortez district, have been brought to the Keystone mill for reduction.

The Nye County *News* of Sept. 29th says the Murphy mill, at Twin River, will be ready in a few days to commence crushing. Business in that section was brisk.

Esmeralda.

From the *Aurora Union* of October 6th: The Cornucopia mine at Partzwick is looking remarkably well. The furnace has been rebuilt, and is working finely. Winter's mill has been thoroughly repaired, and was to be started this morning. They have quite a supply of ore on hand, and intend keeping a sufficient force working the mine to keep the mill running constantly.

Pahranaagat.

The Hardyville correspondent of the *Alta* says: The steamer Nina Tilden leaves here temporarily a splendid 40-horse power engine, and 10-stamp mill, all complete, destined for the Pahranaagat mines via Calville. Gentlemen continually arrive from Pahranaagat, reporting most unfavorably of the mines.

IDAHO.

From the *World* of Sept. 15th:—The California Tunneling and Mining Company has been incorporated in this place for the purpose of running a tunnel from Moore's Creek into East Hill. Stock has been issued and is finding a ready market. There is great confidence among the people here that the tunnels now perforating each side of the hill will strike rich and valuable diggings. A letter from the Wind River expedition was *en route*, says:—I saw a man just in from the head of Green river. He reports diggings that will pay \$20 to \$30 per day to the man. He describes the country in and around the head of Snake and Green rivers as a wash or diluvial mountain and plains.

From the *Times*: Several claims on Monte's Flat continue to yield from \$5,000 to \$7,000 per week. Among them are claims of Redmond & Co., Clifton & Co., the French Co., McNorthcutt & Co., etc. The East Hill tunnel is now 160 feet in length. The dirt taken out yesterday prospected five cents to the shovel.

Same says that there is little doing at mining in Alturas County. The Idaho Company are taking out ore, and occasionally set their mill in motion. Work is progressing on the Ada Elmore ledge; a quantity of ore is stacked up ready for crushing, which will yield from \$60 to \$100 to the ton.

From the *Avalanche* of 29th:—A ton of ore from the Reuter & Johnson vein, crushed in a horse arastra, gave \$48.60 in gold—did not save the silver, but suppose it contained about \$12 per ton. The Reuter & Johnson has been proven to be a true vein for nearly two thousand feet, and will pay by mill process an average of not less than \$60 per ton. The New York and Owyhee mill has been recently enlarged by the addition of twelve or fourteen feet on the north side and its full length. This was done to make room for three more large settlers, a pan for cleaning amalgam, and a room for chemicals and assaying. The Lincoln Company have taken an extension of time to prospect the Allison Ledge. Joseph Gafford, of Keokuk, Iowa, is associated with Judge Lowe in the mining enterprise alluded to in our last week's issue. They have purchased the Forrest ledge. The Vulcan, or first north extension of the Silver Cord ledge, is yielding some fine looking ore. The main shaft is down forty-five feet, and shows an average width of four feet. The casings are smooth and regular. The Silver Cord is producing from twenty to thirty tons each day. The Poorman mine is now supplying thirty-five stamps with ore—ten at the N. Y. & O., ten at the N. Y. & O. F., ten at the Ainsworth, and five at the Webfoot Mill. On the Varney & Carriaco a tunnel is being run from the bottom of a shaft seventy feet deep. We learn that it is looking well—native metal being found.

MONTANA.

From the *Post* of Sept. 22d: Returns from Highland gulch continue favorable. All the ground has been taken up, and claims are valued from \$1,000 to \$12,000. There is no chance for anybody who is "dead broke." The highest run of which we have heard has been \$1,100 in ten hours. Snow to the depth of one inch fell on the night of 18th Sept. in Virginia City. In Summit district, there are 450 men engaged in mining. B. R. Martin has gone East with 600 pounds of rich rock. He expects to return with a mill in the spring. Prickly Pear City (formerly known as Montana City) presents a more animated appearance than it did six months ago, owing to the resumption of bar mining. The mines are at present managed with fair results, prospecting from one to four cents to the pan. The *modus operandi* adopted is ground-sluicing, the creek (Prickly Pear) affording plenty of water and ample fall. At Jefferson City, a New York company are at work on the Gregory ledge, and probably will bring a mill to their ledge next spring.

Letter from Deer Lodge, Sept. 3d, says: News from Elk and Bear gulches is uninteresting. The former is perfectly played out, and the latter is rapidly playing out. Prospectors returning from Salmon river pronounce it as perfect a "bilk" as Elk creek. Highland is just now the center of attraction for hungry prospectors.

Letter from Pipestone: On the Clipper a tunnel has been run eighty-five feet, following the vein. All the ore taken from this tunnel has been crushed, and a large pile is waiting to be taken to the mill, from a vertical shaft, now being sunk 200 feet up the hill from the mouth of the tunnel. The Emigrant, with a tunnel 125 feet, on an incline, and a two and a half feet crevice, is not being worked now, but has yielded \$24 per ton. Some very fine ore is now being taken from the Bully Boy.

Letter from Helena: Thornley's mill is doing a paying business. The large new quartz mill of the East Bannack Company has been working rock which prospects \$2,000 per ton. The mill of the Bullion Company will soon be in running trim. Jim Whitlatch is about having a large 24-stamp mill put up on his property in Oro Fino, close by the side of Prof. Hodges' new mill.

The following are working tests of quartz in Hot Spring district: Boaz lode, one thousand pounds of unassorted ore yielded twenty-seven ounces of gold; Pony lode, two tons of rock yielded one hundred and seventy dollars; Galena lode, twenty-five tons of quartz produced twelve hundred dollars; Prim Rose lode, five tons of rock yielded four hundred dollars; Maiden lode, five tons of quartz produced three hundred dollars.

The *Republican* of the 18th, says: Wessels & Wilkes' 6-stamp mill, in New York gulch, yesterday, cleaned up, from thirteen and a

half tons of rock, \$1,326, in four days' run. A private letter informs us that "a big thing has been struck in the Yellowstone country, and the honest ones are making a terrific break in that direction."

COLORADO.

From the *Denver News* of Sept. 26th: A load of quartz from the "Hattie Jane" lode, near Red Mountain, was crushed in Black Hawk recently, and yielded at the rate of \$1,600 per cord. This is the largest yield, by stamps, from any surface quartz ever treated in this Territory. A correspondent writes us from Montgomery, that prospects are brighter for the mines in that region than they have been for long years past. The Pioneer has very encouraging prospects. They are driving two tunnels on the Parsonage lode. A test of the ore will soon be made, as the company's mill is fast approaching completion. Charley Donnelly has discovered a valuable lode of argentiferous galena. He has sunk a shaft only some five or six feet, and has a completely defined crevice of five and a half feet solid ore. The lode, he calls the Bunker Hill.

Letter from Nevada City (Colorado) says: The different mining companies are working well, and those best informed appear to be cheerful and hopeful.

Boulder City correspondence: In Ward district, the Ni-Wot Company have twenty-five stamps at work, on an inferior quality of ore, which gives a weekly yield of \$2,000 in gold. When some other improvements are made, now in progress, and their other twenty-five stamps are put to work, their weekly yield will be from \$6,000 to \$10,000 in gold. At a depth of forty feet on the Columbian lode, they have a crevice of twelve feet in width.

From the *Journal* of Sept. 18th: Central district has been reorganized. It now extends from Left Hand to St. Vrain's creek, north and south, and from Gold Lake district on the west to the valley. A specimen of the ore recently shown us assayed \$300 a ton; the value being about equal in gold, silver and copper. One shaft has been sunk twenty feet and there are chunks of the purest ore exposed that weigh a ton or more. Hornblende and fluor spar are found in some of the veins, both indications of silver. These mines are situated in a beautiful park, formed by James creek, which has been named "Elysian Park." Quite an excitement exists. Parties are talking of building furnaces, prospectors are surging in that direction, people in the valley are leaving their farms to secure a portion of the newly-discovered wealth.

In Griffith district, the Washington Company owns 5,000 feet of veins. They are now working Burrell and Panama, and are now erecting a reverberatory furnace of fifteen tons capacity per day. The Mt. Alpine Company has recently been reorganized under the name of "What Cheer."

In Argentine district, Mr. Herrick of the Georgetown Company, has put in a dam at Elizabethtown, cut a head race eighty feet through solid rock, and is going to put up smelting works. This company intend to confine their operations strictly to smelting. They have one of the best water powers in Colorado.

Mr. Wright is mining on the Elijah Hise, upon which the Sherman Company own 700 feet. Shaft eighteen feet deep, sixteen inches of ore in the bottom. Messrs. Hermann and Hill selected an average of this crevice and it assayed at the rate of \$1,339.20 a ton. The Elijah Hise is on Sherman Mountain, one and a half miles up the right fork. Mr. Watson is building a reverberatory furnace and small cupel at Elizabethtown, capacity three tons a day, for the purpose of testing the Baker lode, on Kelso Mountain, at the extreme head of the right fork. Mr. Watson expects to have seven feet of \$800 ore when he gets his crevice. That is the average assay of the croppings. A wagon road has been built to the H. W. Beecher, a strong galena vein, high up on Republican Mountain, and it is expected to run the furnace steadily. Assays of the best ore vary from \$100 to \$200 a ton. The lode has been stripped 200 or 300 feet, and a shaft has been sunk twenty or thirty. Mr. Stowell, of the Argentine Company, is erecting works for the purpose of experimenting with the lead process.

In Empire district, most of the companies are awaiting the result of Leeper's experiment, and will resume operations if it should be encouraging. J. S. Jones is building a wagon road from Empire to Middle Park. Mr. Pine is working the Rosarico, running the ore through the Knickerbocker mill.

Some changes have taken place in the works at Lyonsville since we last noticed them. Since the opening of the present season, freight have receded so that it is possible to transport matt to New York by the quantity for \$100 a ton, or to Swansea in Wales for \$200. An arrangement has been made with Mr. B. Hermann, or through him with Vivian & Sons to purchase the matt made at these works, or to separate the copper and bullion for Lyon & Co.

The reverberatory furnaces at the works are precisely like those at Swansea. Their united capacity is estimated at fifteen tons a day.

The Muckenzie Blower has arrived and works well. A pair of new Cornish rollers and a 50-horse engine are *en route*.

ARIZONA.

The *Alta*'s correspondent at Hardyville writes Sept. 28th: Messrs. Lightner & Knowles, the representatives of the firm of Martin Greenman & Co. of New York and San Francisco, are working the Mineral Hill mine, three miles distant from the Planet. It has been heretofore worked upon the Mexican plan. A tunnel is being run to strike the ledge at a lower level. The old works will then be abandoned. A shaft on the Empire, run sixty feet in depth, shows a two-foot vein of 15 to 18 per cent. ore, which will be smelted here, and for that purpose they have put up two Cupola furnaces that will produce four tons of metal from 15 per cent. ore, every twenty-four hours. These furnaces are the same as those now in use in Fresno and Mariposa counties, California, with such improvements as experience has suggested. For running these furnaces they have a McKenzie blower, driven by a 30-horse power engine. The machinery is arranged for the adding of a quartz mill for working the ore of a mine situated at Empire Flat, nine miles below here and close to the river. This ore is rich in gold, twenty-seven tons of it, worked in Europe, yielding \$246 per ton. Seventy-five tons more have been shipped, from which return has not yet been received. The ore carries about twenty per cent. copper. A small sized furnace is in operation on the Eliza mine, owned by the Central Company. It is said to be a complete success, and as evidence of the fact, I saw some of the matts of copper they have produced, that weigh from 150 to 200 pounds each. They claim that the institution pay to the tune of \$200 per day, net. Lightner & Knowles shipped, one month ago, 75 tons of 30 per cent. ore, and have now ready for shipment 160 tons. Their shipments amount to about 100 tons monthly. The ores are from 30 to 60 per cent. Ores less than 30 per cent. will be reduced here. A 10-stamp mill for Col. Woolsey, of Prescott, is being loaded up for transportation to that place. The remainder of the machinery for the Moss mine has arrived, and that mill will be at work ere long. Mining is being vigorously prosecuted. Rich ores have lately been struck in the Antietam lode in the Sacramento district.

ANOTHER NITRO-GLYCERINE EXPLOSION.

About half past six o'clock, on Saturday evening last, the residents of the southern portion of the city were suddenly startled by a very loud explosion, which was soon found to have proceeded from the bursting of a lamp on board a small vessel at anchor in the Bay, near the junction of Third street bridge with Fourth street, the particulars of which have been fully given in the daily papers. The supposition of the *Alta*, that the can had been emptied of its contents, according to the order of the captain, and subsequently filled with coal oil, and that the lamp was filled with a portion of the nitro-glycerine which found its way from the bottom and sides of the can to the top of the oil, is untenable, from the fact that nitro-glycerine will not float upon coal oil. Neither was it necessary that the lamp should be allowed to drop, in order that the explosion might occur, as suggested by the *Call*, from the fact that capillary attraction would soon draw up a portion of the oil along the wick, which on being heated by the flame, or from any other cause would explode, without percussion, the moment it reached 360° of temperature. There can be but little doubt that the lamp was filled with nitro-glycerine. The violence of the explosion and the loudness of the detonation were so great as to be accounted for in no other way. We were upwards of a quarter of a mile distant at the time, and in a closed room; yet the first thought suggested to our mind, from the similarity of the report to that of the one on the premises of Wells, Fargo & Co., was that it proceeded from nitro-glycerine. The investigations of the Coroner have fully established the fact that such was the case.

THE FALLS OF ST. ANTHONY are perceptibly changing by the breaking away of the limestone edge, and recede at the rate of about ten feet a year. The owners of the water-power have decided to check this process by the erection of inclined aprons, which will break the force of the water and conduct it away from the quicksands which in many places underlie the rock.

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. Thomas Starr is Agent for the MINING AND SCIENTIFIC PRESS in Nevada, and will canvass the principal cities and districts of that State, August 25, 1866.

Mr. O. P. Truesdell will act as our Corresponding Agent and Solicitor in the interior of this State, from this date August 25, 1866.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.

SAN FRANCISCO, Jan 11th, 1866.

San Francisco:

Saturday Morning, Oct. 13, 1866.

NOTICES TO CORRESPONDENTS.

OWING to the large amount of correspondence received relating to interesting points connected with Mining, Metallurgy, Mechanics, etc., we are compelled, for want of time and space, to reply briefly in the following form to a portion of such queries as are of general interest.

B. N. WASHOE.—Sanidin is the name given by several mineralogists to transparent or glassy feldspar, such as is found in trachytic and other volcanic rocks. It is called "Sanidin" from the Greek term *sanis*, a hoard, the crystals of the mineral being tabular, or hoard form. The name *ice spar* is sometimes given to a very similar variety, found in Vesuvian lavas. The term also includes pellucid varieties of other species of feldspar. From the fact that *sanidin* frequently accompanies rich mineral veins, its presence, as at the Comstock lead, is usually considered a favorable indication. Barns Richtovin, in his treatise on the Comstock, draws very favorable conclusions from the presence there of this mineral.

ONE INTERESTED, DEL NORTE.—We are afraid that in the case of low grade ores, sulphureted copper, say of less than 12 or 15 per cent., it will be impossible, in the existing state of the roads and the want of other conveniences, to so far reduce them, or form what is called a *regulus*, on such an economical cost as will yield a profit to the miner, especially from such a distant place as your locality. Rich oxyds, carbonates, or the two named, even intermixed with sulphurets, when containing from 30 to 50 per cent. of metallic copper, can be very profitably reduced to coarse metal, containing about 96 per cent. of copper, where, as in your case, wood is plentiful. Under certain conditions, copper ores can be more economically concentrated by the moist than by the dry method of reduction.

S. B. TUOLUMNE COUNTY.—Reports vary as to the practical utility, by which we mean, the amount of gain over and above the additional cost incurred, by the employment of sodium amalgam. Everything of importance which has appeared relating to this subject, has been published in this journal; some articles, as the experimental trials by Prof. B. Silliman, and the claims set forth by the inventor, Mr. Wurtz, were of considerable length, and to which we must refer our correspondent for fuller details. An interesting article on this subject appeared in our last issue, which you must have received subsequent to the date of your note.

G. J. AUBURN, AND H. D. K., IOWA HILL. THE SYPHON.—We have been favored by a communication from each of the above gentlemen; as, however, the larger part of their respective letters dwell upon points which have already been noticed by other correspondents, we refrain from publishing them in full. "G. J." employs and recommends fixing an air-chamber over the highest flexure, above which he places a stop-cock, with a hand-pump over all. "H. D. K." states that he has a syphon which runs for six to eight months. To such of our readers as may have followed, and still feel interested in the discussion, we wish to point out what may be easily gathered by carefully studying the various letters which we have recently published on this subject, that two causes, chiefly, prejudicially influence the working of syphons—one by flexures causing air to accumulate at the culmination of their course; the other the gradual seepage of air to the upper portions of the syphon, when from the length of piping used, or great amount of fall, an inadequate flow of water enters the short leg of the syphon, to supply the capacity for outflow of the longer leg. The former evil could probably be remedied, or greatly lessened, by erecting a simple, cheap kind of stage, on which to lay the piping. In this way curvatures could, in almost all instances, be avoided. The second evil might probably be mitigated, if not entirely remedied, by having a stop-cock at the point of exit, and carefully regulating the outflow at something below the capacity of the shorter leg to supply.

STEAM BOILER EXPLOSIONS.

The latter clause of the verdict in the inquest on the late explosion of the steamer Julia's steam drum is most significant in its import, and points out the true direction in which we should look for a greater degree of immunity from injury by steam boiler explosions. The jury say:

"From the evidence the jury also find that the construction and inspection of said drum fully complied with the requirements of existing laws; they also find no cause of blame, except in the high standard of strength allowed by law for iron used in the construction of steam drums and boilers."

This is the first time in our recollection a jury has brought in an indictment, and a righteous one, too, against the government, for its culpable action in legalizing a most dangerous practice—that of allowing, by law of Congress, the owners of steamboats to carry a pressure of steam equivalent to 115 lbs. to the square inch of $\frac{1}{4}$ -inch iron. That the pressure thus "allowed by law for iron used in the construction of steam drums and boilers" is dangerous, and highly so—even when the best attainable iron is used, and when that iron is absolutely free from any accidental flaw—is perfectly demonstrable, and well known to every engineer who thoroughly understands his profession. Hence, we say, that the verdict or indictment of the jury, in the case of the explosion on board the Julia, is a just one. The agents of the Steam Navigation Company, and the captain and engineers of the Julia, might have been to blame for assuming what they did or should have known, was a fearful risk; but they did no more than Congress had told them they might do; and no more than, under the same sanction, is in daily practice by the owner of every high pressure boiler, stationary or otherwise, throughout the Union. The truth of this proposition we shall make evident to the satisfaction of every reader, whether a mechanic or not, before we conclude this article. We hold that the blame, in this case, as in nine-tenths of all similar cases everywhere, should fall, just where the jury has placed it, upon the Government, and, of course, by implication, upon the people themselves, for they are the government.

Column after column has been written and published, and learned men have for years been trying to think out some scientific cause for boiler explosions, which some other scientific cause might remedy. They will never find either. The cause is mechanical, and its remedy simple and sure.

We hold that there is but one universal cause for boiler explosions, and that is "insufficient strength in the boiler to resist the pressure of steam alone, to which all boilers may sometimes be contingently, and to which they are in all cases generally exposed." We will confine our examination to cylindrical boilers alone—the principle is equally applicable to all; and we will here premise, by saying, that the whole matter has been recently discussed and placed before the country by the American Association of Science, which lately met at Buffalo, New York.

Boilers are usually constructed of rolled plates 1-4 to 5-16 of an inch in thickness. We have already stated that Government allows a pressure of 115 lbs. to the square inch on $\frac{1}{4}$ -inch iron, in a 40-inch cylinder boiler, and all its equivalents in proportion. This is equal to a tension of 9,200 lbs. per square inch. Let us see how safe this allowance is.

Actual experiments, carefully made under the direction of the British government, and which are everywhere received by engineers as reliable, and which American engineers work from, have shown that 54,000 lbs. to the inch is the highest standard in boiler plates, consistent with safety. It requires but a small addition to that figure to fracture the best iron. Private experimenters, and among others Napier & Sons, of Glasgow, have placed it at a lower figure. But we will take the highest as our standard.

If the plates of a boiler were welded, the whole strength of the iron would be available

to resist the steam put upon it; but as such is not the case, we must deduct the amount of iron cut away in punching for the rivets. The rivet-holes, according to usual work, occupy 35.7 per cent. of the line of surface joined, leaving but 64.3 per cent. available for resistance. The act of punching causes more or less deterioration of strength in that portion of the iron left. Then the strong pressure from hammering and heading down the rivets exerts a further deteriorating influence. From these last considerations the best authorities add 14.7 per cent. of further deterioration, leaving for available use but 50 per cent. of the original strength of the iron employed.

Another consideration is now to be taken into account—the limit of elasticity in the iron, beyond which permanent extension would occur. This the best engineers have set down at one-third the breaking strength.

Now, then, we have, first 54,000 lbs. as the full strength of tension per square inch; from this we must deduct, as shown, 50 per cent. for rivet-holes and the closing up of the rivets. This deduction will leave us but 27,000 lbs. In considering the tension of iron, we have seen that it is safe to subject it to only one-third its breaking point—one-third of 27,000 is 9,000, or two hundred pounds less tension than, as we have seen, Government allows us to subject iron to, when used for transporting passengers, in the shape of steamboat boilers!

Thus Government allows engineers to make constant use of 200 lbs. more tension than practical experiments have shown to be safe, even for a moment, leaving nothing to cover accidental over-pressure, from short stoppages of discharge while steam is being continually made, or for any similar causes; and trusting merely to the under-estimate of engineers, or the accidental superiority of the iron in use, for the safety of the thousands of lives which are thus constantly exposed.

In almost or quite all other calculations involving the tension of iron, one-half the tension necessary to effect a permanent elongation—and of course a permanent weakening—is, in most cases, considered the limit of safety by judicious engineers. In other words, 4,500 lbs. is the utmost limit to which a careful engineer would expose a transverse section of iron, such as we are speaking of, in any other place than in a steamboat boiler. That is, one-sixth of the force required to produce a rupture ought to be, by the last mentioned rule, quite sufficient to risk, and leaves none too broad a margin for safety, especially where so much human life is endangered as is usually found on steamboats. Such a nearness to a dead line is quite as close as a person of ordinary caution would care to approach.

Let us look again at the practice. We have seen that engineers estimate the point at which we may reasonably expect a rupture to be 9,000 lbs., and yet Government allows steamboat owners to carry 9,200; a limit which is often reached in ordinary steaming, everywhere, by high-pressure boats. In all other engineering operations, as we shall now proceed to show, only one-sixth of the amount of 9,000, or 1,500 lbs., is considered safe and allowable. That is 1,500, engineers' estimate, instead of 9,200 in Government allowance. Surely the people can never have fully understood this thing, or the custom of such enormous risks could never have obtained and been sanctioned by Government!

One word by way of explanation of what we mean by this allowance of one-sixth the estimated actual strength in other engineering operations than those relating to the use and confinement of steam: If an engineer is to build a bridge, either of iron or wood, his calculations are never based on allowing a greater load upon it at any one time, than one-sixth of its estimated breaking weight—one-seventh is often the allowance. The strain allowed on the Victoria tubular bridge is but one-seventh its estimated strength; that allowed on the Niagara Suspension Bridge is one-sixth; that to be allowed on the magnificent suspension bridge now being erected over the Ohio at Cincinnati, has been fixed at one-seventh; the

blocks of stone at the base of the great dome of St. Peter's, at Rome, are subjected to only one-sixteenth the weight which would crush them; the stones which press the base of St. Paul's, in London, are but one-fourteenth their capacity for resistance. In fact, the practice of engineers is significant, in this point everywhere, in all structures and in all parts of structures, with the single exception of steam boilers! Why are they made an exception? Let the ghastly skeletons of the hecatombs of human beings who have been sacrificed to this cupidity of man, confront our next Legislatures and our next Congress, until those bodies are willing to pass laws which shall reduce the risk at present allowed at least one-half—less than that will not afford any adequate protection. One-third the present allowance, indeed, is margin little enough in steam boilers, liable as they are to so many unforeseen and often unavoidable accidents. If engineers would always be careful and cautious, less might do, but human nature is such that constant, unremitting care can never be expected.

There has not been a boiler explosion on a passenger steamboat on the river Thames, England, for about twenty years. The surviving engineer of the last casualty, in 1847, was found guilty of manslaughter and sent to the penitentiary for seven years.

In Sweden the laws are even more strict than in England; and the first explosion of a passenger steamboat on any waters subject to that government, to the best of our knowledge, is yet to be heard of. A properly constructed boiler, of good material, properly supplied with water, kept in good order, etc., will never explode; but in controlling a power of such terrible energy as steam, where we have a magazine of enormous force confined upon all sides, excepting only a single point, where it may be liberated for use; and when such a large amount of human life is constantly within fatal reach of its destructive energy, it would seem but a plain duty that those who manage it should be compelled to exercise at least one half as much caution as is, by general consent, required in any other engineering operation in which the risk of life and limb is involved. With such a limit set to the owner, it would be but reasonable to fix the heaviest penalty on the employee in case of accident, except some unforeseen and extraordinary cause, under which accidents would scarcely occur one time where a hundred do now. The only objection to such a radical change in our steamboat laws, would be the necessarily increased expense of building boilers and working steam under such changed conditions. But the steamboat owner has his remedy in increased charge; and who would not rather pay it than take the risk now assumed by every person who steps on board a boat, which is built and run in strict accordance with the law. People would absolutely refuse to cross a bridge which should be tested and pronounced safe on precisely the same principle that a boiler is considered safe. The whole country would be in an uproar to abate such a dangerous structure. Yet we unthinkingly take the risk every day on board our steamers, and think nothing of it. Perhaps, though, people generally have never fully understood the risk, as those who read this article may now understand it. If any doubt what we have written, let them take it to any well educated engineer, and our word for it, they will find all that we have said fully sustained.

WORKING POOR ROCK.—The Havilah Courier wishes to know by what process rock which will not pay over six or eight dollars per ton can be worked profitably; and says the miners of that section are afraid to tackle \$10 and \$15 rock. No unusual process is required to make eight and ten dollar rock pay, in any locality, where supplies can be obtained as cheaply as in Nevada or Tuolumne counties; provided the veins are large and well-developed, so that the rock can be cheaply mined. We might instance the Adelaide mine in Mariposa county; the Watawa, Union, Patterson, Blue Tent, and perhaps others, in Tuolumne county; Soggs' mine in Nevada; Perria's mine in Grass Valley, and the Eureka mine in Plumas county, as among those which are worked to a profit with a yield not exceeding eight dollars per ton. No doubt there are a great number of others to which reference might be made if we had the statistics at hand. Such mines can only be worked at a profit by the careful avoidance of all unnecessary expense, and under the best financial management. Of course small veins cannot be worked at so low a figure.

CRUSHING MACHINERY.—A large-sized Hanson quartz crusher as shipped for the Ogden mill in Nevada, from the Golden State Foundry, on Thursday last.

MINING MISMANAGEMENTS.—SUGGESTIONS FOR THE FUTURE.

A very large part of the injurious consequences which have resulted to innocent mining stockholders are chiefly attributable to the apathetic feeling which pervaded that large body, so long as inflation and a continuous general rise in the value of mining stocks existed. Even after many of the evils and frauds complained of were made known, and thoroughly exposed, no attempt was made by those interested to induce the late Legislature to form enactments calculated to prevent, or at all events to render more difficult in future, the malpractices of the past. Scarcely anything more was done than amending the laws relating to assessments. Perhaps this is not so much to be regretted, because stockholders, under the general Incorporation Law, have the remedy in their own hands, of which, if they do not take advantage, they have no right to look for the sympathies of the non-interested.

In the first place trustees ought only to be elected for a term of three months, to carry out which it would be necessary to hold a general meeting of the stockholders once every quarter of a year. At such meetings the trustees should give a full account of their past stewardship, and, above all, the superintendent or trustees should, at the same time, present an account of the works proposed to be executed during the following quarter, accompanied with a detailed account of the probable outlay and returns; and no works or contracts should be permitted excepting at the personal risk of the trustees, other than those submitted and approved of by a majority of the stockholders present, or by proxy, at such quarterly meeting. It is in the power of the proprietors of every mining incorporation to embody such rules in their by-laws, and if stockholders neglect to do so, the blame lies with themselves; or, if after enacting such, they fail to attend such general periodical meetings, and fail to take any personal interest in the administration of their affairs, however much on moral grounds it may be regretted, it is too much to expect the strong sympathies of their neighbors for misfortunes, often entirely and in general chiefly attributable to their own negligence.

In making this last remark, we have in view a strong case in point. The Ophir company, owing to the fact that a sufficient number of shareholders could not be assembled to form a quorum, have not held a general meeting for the transaction and consideration of its affairs for nearly twenty months; in which interval, if the periodical but unofficial accounts are to be credited, something like one million dollars' worth of bullion has been obtained from this mine; yet, no dividend has been paid or is promised to be paid out of this enormous sum, but, on the contrary, rumors circulate that it is now deeper in debt than it was at its general meeting, held about twenty months ago. Be that as it may, the fact is patent that something like one million dollars' worth of bullion has been abstracted from this mine, not one cent of which has found its way to the pockets of any of the stockholders, unless to such as were paid officials. It is equally apparent that the mine has had abstracted therefrom, even at a low valuation, one million dollars' worth of specie. Under such circumstances, it would naturally, to a sensible body of stockholders, alert to their own interests, become a serious question whether or not, seeing the deeper they sink the more difficult and expensive becomes the cost of extraction, it would not be better to suspend operations until a more economical and efficient mode of management could be adopted. An advantage of only twenty per cent. in this respect would probably result in realizing to the stockholders a quarterly dividend of twenty to twenty-five dollars per foot, and without any "rigging" permanently enhance the capital value fully fifty-five per cent. over current rates. At present all the benefits obtainable are absorbed by officials.

We advocate quarterly meetings, settlements, accounts, and dividends, as being the true medium between annual and monthly statements. It often occurs in mining that it is prudent and

economical to put for short periods nearly the whole force of the establishment on unproductive or little productive works; this can scarcely be done when dividends are to be provided for monthly. The Gould & Curry company discovered this, and, therefore, very prudently made a change from monthly to quarterly payments of dividends.

NEW PATENTS AND INVENTIONS.

Under this heading we shall mention, from week to week, on occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

NEW INVENTIONS.

ANOTHER SAFETY CAGE.—According to the Gold Hill News, Mr. Frank Thayer and Aleck Dunn, two practical miners of that place, have devised a new safety cage, which experiments show to be "ahead of anything ever before invented as a 'safety cage.'" A loaded car will not fall over half an inch on the cutting or breaking of the rope by which it is being elevated; while upon an adjustment of the rope, a slight pull will instantly free the teeth which have caught and hold the cage, and allow the cage to be raised or lowered as the case may be. The News further says this invention of Thayer & Dunn is represented to us as being entirely different from that of Frank Denver & Co., and its mechanical discoverers are going to apply for a patent, as it is spoken of by Charley Bonner and others as superior to any safety cage ever invented. It is in operation at the Curtis shaft.

NEW MODE OF STEAMBOAT PROPULSION.—Some quite extensive experiments have recently been made in Europe for the propulsion of vessels, by the reaction of water forced out of pipes, which are supplied by suction through the bilge or bottom of the vessel. An important improvement on the European principle has recently been devised by Messrs. Kimble & Hubbe, of New York, whereby the objections of the European invention is said to be entirely obviated. The New York invention is, moreover, made applicable to "double-enders," so that a vessel can be made to move either way with equal facility. This is accomplished by an arrangement by which the outside projection of the nozzle pipes can be made to point in either direction, and the water being forced out of them, strikes or reacts upon the water in which the vessel is floating, thereby producing a propulsive power. It is claimed that vessels constructed on this principle attain a much higher rate of speed, with a less consumption of coal, than is the case with paddle-wheel or screw steamers, that the steering of such new vessel is easier and more certain, that the shaking of the vessel (caused by the action of the engine on the screw or paddle-wheel) is here entirely avoided. These, and other advantages, make it desirable to test boats constructed on that principle, and for that purpose the inventors have designed an experimental boat on a large scale, which they intend to build and to sail with it on the Hudson river, and which they think will attain a speed of twenty-five or thirty miles an hour.

PATENTS RECENTLY ISSUED.

TRIMMING LAMPS.—C. H. Bagley, of Elgin, Ill., has devised an important attachment to be affixed to the wick-tubes of coal oil lamps, by which they may be trimmed without removing the glass or the use of shears. This improvement consists of a scraper which is made to move across the top of the wick tube and its wick, thus scraping off or removing the charred portion of the wick.

CARPENTER'S CLAMP.—Hermann Schmidt, New York City, has invented a carpenter's clamp which is provided with movable nuts in such a manner that by releasing the nuts from the screws, the two jaws of the clamp can be moved freely in either direction and readily adjusted at the desired distance apart.

STREET LAMP.—B. A. Johnson, Jeffersonville, Ind., has devised a plan for forming the bottom or base portion of a street lantern, of cast metal, and the body of sheet metal, whereby sufficient strength is secured in connection with durability and convenience of handling, and diminished expense.

CIGAR HOLDER AND HAT HOOK.—Charles Gschwind and John Grether, Union Hill, N. J.: This invention relates to a simple device which can be conveniently carried in the pocket and used as a cigar holder, and also a hat hook whereby the hat can be suspended in any convenient spot.

PLOW COULTER.—Samuel Casebein, Roseburg, Oregon, claims an application to plows of an improved cutter.

PATENTS can be obtained for citizens on this Coast through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. In one-half the time it takes to operate through Eastern agents. From our familiarity with the subject of most California inventions, and the benefit arising from personal explanations, we are prepared to present claims with greater accuracy than could reasonably be expected of distant agents. Advice and Circulars FREE. DEWEY & CO., Patent Agents, 505 Clay Street, San Francisco.

CONTRIBUTED FOR OUR CABINET.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

C. T. ELLSWORTH, Shasta, sends us a massive specimen of silver ore from the Chicago mine, Shasta county. This ore contains a very large percentage of argentiferous galena, and affords another proof that silver will yet be one of the important mineral productions of California. The gangue is a white quartz, slightly tinted with green, evidently taken from a talcose slate bedrock. We would thank the donor to give us information concerning the mine and its development.

HUDSONITE.—Such is the term which New York mineralogists have given to a new (?) mineral found in considerable mass about forty-five miles from New York; some specimens of which have been received by mail, since our last publication, by Professor Rowlandson. They were transmitted to that gentleman by Professor C. S. Richardson, of New York, accompanied by the statement that it was found in considerable quantity about forty-five miles from New York; but that assays differed considerably as to its composition. Its average may probably be taken at thirty per cent. sulphur, three and a half per cent. copper, nickel one to two per cent., iron fifty per cent., and the balance gangues, with a small quantity of what appears to consist of a polysulphide of rather an unusual character, and which might easily be taken for either sulphide of molybdenum, or impure plumbago. The last named substance, from the letter of Professor C. S. Richardson, appears to us to have been mistakenly pronounced plumbago. Hudsonite does not appear to differ, in external appearance, from the mineral we alluded to in our last number as having some years ago been found in Scotland, on the estate of the Duke of Argyll; excepting that in Hudsonite, sulphide of molybdenum may be present, accompanied also by silver and gold. The external character of Hudsonite greatly resembles the specimens sent to us by Mr. J. Alden Smith, from Colorado, and which are supposed to be of meteoric origin.

DISASTROUS FIRE.—A very disastrous fire occurred on Thursday morning at the corner of First and Market streets, in this city. The fire was probably the work of an incendiary, as it was seen to break out almost simultaneously in several different places. The principal sufferers were Eisen Bros. & Co. of the Pioneer Flour Mills; Wheelan & Co., of the Alta Mills, and W. & T. Garratt, machinists and brass founders. The loss of each of these parties is estimated at from fifteen to twenty thousand dollars, not more than one-third of which was covered by insurance. The loss of the Messrs. Garrett is particularly heavy, in buildings, stock, tools and machinery, which it will require some time and a large cost to replace. These gentlemen are well known as enterprising and energetic men, and we doubt not they will soon be on their feet again. They have the fullest sympathy of their friends and the community generally. The total loss was about \$70,000.

A Hint to Advertisers in General, and San Franciscans in Particular.

The following article from the *Mountain Messenger*, published in Downieville, the county seat of El Dorado, illustrates an important fact which some people are prone to overlook, viz: that it is not the lowest priced advertising which is the cheapest. For instance, an advertisement inserted for \$30 in a journal issuing 3,000 copies, is twice as cheap as at \$20 in a paper having only 1,000 circulation:

Judicious Advertising.

It is passing strange how few business men in the cities of this State understand advertising judiciously in the country press, whether making their arrangements with the publishers or their agents in San Francisco. There are five different agencies which receive advertising for the country papers of the interior, only two or three of which are able to secure an agency for first-class papers, such as have an extensive circulation and established rates of advertising, from which they decline to vary at the option of the advertiser. These papers are usually full of advertising at fair rates, only a trifle in advance of papers having a very limited circulation. The other agents and publishers have no established prices, and consequently overcharge if they have an opportunity, but generally take advertising at about twenty per cent. less than usual rates; and the foolish advertiser who gets his advertisements into a score or two of these journals doubtless thinks he is advertising judiciously and cheaply, when in fact he is paying the very dearest price, considering the limited circulation his advertisement obtains. Thus, many business men, though they doubtless find it pays to advertise, even in this class of papers at this low rate, are advertising injudiciously and paying double rates for the circulation they desire to and might obtain by advertising in first-class papers, the rates of which are but a trifle higher than those which advertise for such prices as they can obtain. These low price advertising agents work an injury to both publishers and advertisers, and are rarely able to liquidate when the quarterly settlement is due, and their names are handed about through the press with epithets of well merited contempt.

While the penny-wise style of business referred to pays one class of advertisers very well, it works injury to others who fail to obtain the value of their money. There is hardly any kind of trade extensively carried on in San Francisco that will not pay to advertise throughout the State, to the mutual benefit of the advertiser and publisher; but a want of general information concerning the amount of trade to be expected has established a want of confidence to try. Advertising in the East is more general because statistics of trade and its profits prove its value, almost without trial. The inducements to advertise in this State are no less, as we propose to show by reference to the consumption of goods in this country.

From the Auditor's office we learn that there are no less than two hundred licensed retail dealers in Sierra county, whose annual sales in the aggregate foot up the handsome sum of \$3,500,000, and it is to be presumed that none of these dealers have overstated their sales. To this amount may be added \$1,500,000 worth of goods purchased on private account for miners' winter stores, and for the supply of incorporated companies and quartz mills, making in total a valuable trade of about \$5,000,000 annually.

The wealth and population of a section, and the influence and circulation of an old established paper, determine its value as an advertising medium—a matter never lost sight of by an experienced advertiser.

The *Messenger* is one of the oldest and best established papers in the State, and has always enjoyed an extensive circulation (wholly unaided by party contributions) equalled by no other in this locality at any time during the last ten years, and has entered upon its thirteenth volume with increased subscriptions and extended advertising patronage. It has been twice enlarged since its removal from La Porte to Downieville, in 1864, and now presents more reading space and type than any other weekly local journal in the State (not connected with a daily issue), and more local matter. No business man is without it, and its circulation extends throughout the mines in all the different camps of this county and vicinity, as follows: Forest City, Aleghany, Chips' Flat, Minnesota, American Hill, Sierra Valley, Downieville, Goodyear's Bar, Camptonville, Eureka, Port Wine, La Porte, Sawpit Flat, Gibsonville, Newark, Poker Flat, Howland Flat, Pine Grove, and St. Louis, besides many other smaller camps.

The *Messenger* has an extensive job office, and does the printing and advertising of the county.

PATENT BUSINESS.

We have lately associated with us in the Patent and Mechanical Department of the MINING AND SCIENTIFIC PRESS, a gentleman of superior ability and attainments, who has arrived direct from the leading patent agency in New York City, and having a faithful and reliable associate in Washington City, we are now better than ever before prepared to secure the claims of our applicants, in a careful, prompt and efficient manner.

DEWEY & CO.,
San Francisco, June, 1866. Patent Solicitors.

By MAIL.—The MINING AND SCIENTIFIC PRESS will be sent by mail to any part of the civilized world. In case of removal, subscribers have only to inform us of the post-office address of their old and new location, and the paper will be sent accordingly.

F. N. BACON, LINAS STEWART.

We receive, regularly as clock work, this exceedingly valuable and interesting journal.—[Napa Reporter.]

Brevities.

A TELEGRAPHIC short hand has been invented by Captain Bolton, an Englishman.

TWENTY-SIX pounds of mulberry seed has just arrived from Japan. It cost, delivered here, about eleven dollars per pound. Wilson Flint was the importer.

It is stated that about two thousand miners are now at work in Louisa and Goodland counties, Virginia, and that the average is two pennyweights a day to each miner.

It is said that the workmen in the silver mines of Saxony receive only thirty cents a day for their labor. Boys of fifteen years work eight hours, and receive twelve cents.

DURING the month of August upward of one hundred telegraph poles were destroyed between Salt Lake and the Sierra Nevada by lightning; an accident that had never occurred before.

In Pittsburg, Pa., there are forty-one foundries. In the first-class establishments from twenty-five to forty tons of metal can be used in a single casting. They employ an average of fifty hands.

A STEAM railway is to be built to the summit of Mount Washington. Half a mile has been completed, and is a success. Between the rails lies a wrought-iron ladder, in which the feet of the cogged driving-wheel find a firm hold. The ascent is one foot in three.

A LETTER from Dalton, Georgia, says that one company there took out \$10,000 worth of gold from the mines in one day, and the capitalists of New York and Boston are about to ship extensive mining machinery to that place for the purpose of working the mines.

THE yield of the precious metals in the United States for 1866 is estimated at \$85,000,000, by the American *Exchange and Review* of New York. The largest proportion is, of course, from California. Then follow in order, Nevada, Montana, Idaho, Oregon and Colorado.

The diving-bell used in building the piers for the Newburyport bridge over the Merrimac river, is the largest bell ever made in this country—weighing upwards of six tons. It is pyramidal in shape, and is six feet square at the bottom, and about seven feet in height to the apex. It is constructed of iron two and a half inches in thickness.

THE Reese River *Reneille* describes a singular plant lately found growing in the hot water of Hot Creek district. It is a delicate vine-like plant, almost as fine as hair, holding myriads of tiny leaves, nearly imperceptible, and of bright emerald green. It thrives only in water so hot that the hand cannot be borne in it. Many efforts were made, in spite of scalded hands, to gather and preserve specimens, but it was so tiny and delicate that it was found to be impossible.

A HEATHENISH ARISTOCRAT.—The Duke of Richmond objects to having his estate of Goodwood Park disfigured by posts and wires, and a local electric telegraph, which is only used on special occasions, which should pass through his place, has a break which is filled up with carrier pigeons, whose flight over his grounds he cannot control. The distance of the break is six miles. The pigeons occupy three and a quarter minutes in making the transit.

Machinists and Foundries.

PALMER, KNOX & CO.,
Golden State Iron Works,
Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF
MACHINERY,
STEAM ENGINES AND QUARTZ MILLS
DUNBAR'S IMPROVED

Self-Adjusting Piston Packing,
Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S
NEW GRINDER AND AMALGAMATOR
HEPBURN & PETERSON'S

AMALGAMATOR AND SEPARATOR,
Tyler's Improved Water Wheel,
Giving the greatest power, at lower cost, than any wheel in use. There are over 1,500 runnings, giving universal satisfaction.

KNOX'S AMALGAMATORS,
WITH PALMER'S PATENT STEAM CHEST,
Superior for working either Gold or Silver Ores.

Genuine White Iron Stamp Shoes and Dies
Having been engaged for the past eight years in quartz mining, and being conversant with all the improvements either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 15v19xy-11

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic Hay, Rag, Screw and Drop Presses, Coining Machinery, File Drivers, Bark and Malt Mills, and all kinds of Castings.

ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

BOILERS. Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's Improved Tractory Curve Pan, Zeiss's Wheeler's Improved flat bottom pan, Beldin's pan, Veatch's tubs, Printer's concentrators, Wakle's pans, Beers' pan, German Barrels, Arastir Oaring, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of Iron. All work done in the best manner at the lowest cash prices.

of Mr. LOCHHEAD, who has been in the business in San Francisco for the last fourteen years, and enjoys the reputation of having built ONE HUNDRED AND SEVENTEEN STEAM ENGINES.
Screw Propellers of all kinds, and Steam Boat Machinery generally, made to order, and warranted to give perfect satisfaction in every particular. 25v12-3m

MR. O'HARA has erected a new roasting furnace at Empire, near Carson, which, according to the Nye county News, is a complete success. A letter is published which states that the new furnace had just finished working seventy-five tons of tailings at Dayton. The work was accomplished in seven and a half days. The letter adds:

Messrs. O'Hara & Thompson have a contract to erect a furnace for the Yellow Jacket mill, and will also put up one at the Mexican mill. They have endeavored to keep their operations as quiet as possible, until they had satisfied those in their own section, and now say that as soon as they get one erected here, they will "play out" all the old furnaces. They can roast first class ore for \$1.75 per ton, and all ores that require less than eight hours' roasting for \$1.25 per ton. For reference I am authorized to say that if any one has a doubt of the perfectness of the furnace, for them to address Gov. Bladell, Jno. B. Winters, or A. B. Paal, and they will satisfy them that it is a perfect success. The seventy-five tons roasted at Dayton cost \$1.12½ per ton.

EASY TO REMEMBER.—The length of the Atlantic cable from the point where it leaves Valentia Island to the spot where it is landed at Heart's Content, is precisely 1866 miles. It is a singular coincidence that its length should exactly conform to the date of the year of its completion.

With four weights of respectively one pound, three pounds, nine pounds, and twenty-seven pounds, any number of pounds from one to forty may be weighed.

THE LAST VOLUME.—George Bancroft, the historian, is about to publish the last volume of his history of the United States.

Rheumatism!!
ANOTHER WITNESS!

SALMON FALLS, June 17, 1865.
H. BOWMAN—DEAR SIR: HAVING HAD A FAIR test of the virtues of RICHARDS' REMEDY FOR RHEUMATISM, I take great pleasure in stating that its effects with me have been very beneficial. I have been afflicted for three years severely afflicted with Rheumatism, and having tried everything I could hear of, without any permanent benefit, I concluded to try this.
On taking the medicine, in three days I experienced great relief, and in one week was entirely free from pain, and had completely recovered the use of my limbs, which had become almost powerless, so much so that I could not dress myself without assistance. Since that time I have been free from Rheumatism. I have recommended RICHARDS' REMEDY to numerous friends, and in every case it has proved successful. I therefore take great pleasure in recommending it to all who are afflicted with Rheumatism, and especially to all mercurial chronic Rheumatism cases.
Yours respectfully,
(Signed) ERASTUS PARSONS,
President of the Gen. Grant Mining Company.

RICHARDS' REMEDY is for sale by
H. BOWMAN,
Druggist, Sacramento. 1113
Price, \$2.50 per Bottle.

Important to Californians.—Many inventors have lately had the idea of patenting machinery and in some cases fatally delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with one but active and experienced solicitors. The Mining and Scientific Press PATENT AGENCY has strictly complied with the regulations of the Department, and properly filed all necessary papers as Claim Agents.

Office, 629 Washington street, San Francisco. 212-4m

EUROPEAN

METALLURGICAL WORKS,

—AND—
Practical Mining School,
Bryant Street, between Third and Fourth,
SAN FRANCISCO.

THE PROPRIETORS are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the melting process attended to. Sulphurated pyrites, and the so-called "reluctant ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, robbing by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desiring to pursue the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

S. F. KIMBALL, J. R. MURPHY.

M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

N. C. FASSETT, Secretary.

Office, 402 Front street, San Francisco.

Ethan Allen Gold and Silver Mining Company.

Location of Works: Austin, Lander County, Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of October, 1886, an assessment of fifty cents (\$0.50) per share was levied upon the capital stock of said Company, payable October sixth, 1886, in United States gold and silver coin, to the Secretary, at the office of the Company, 620 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the sixth day of November, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twenty-seventh day of November, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

H. B. CONDON, Secretary.

Office, 620 Washington street, (Room 5) San Francisco.

George Washington Gold and Silver Mining Company, Silver Mountain District, Alpine County, Cal.

Assessment No. 14. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventeenth day of September, 1886, an assessment of two and one half dollars (\$2.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, only.

Any stock upon which said assessment shall remain unpaid on the twentieth day of October, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fifth day of November, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. G. WOOD, Secretary.

Office, 338 Montgomery street, San Francisco.

Hannan Copper Mining Company—Location: Low Divide District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighteenth day of September, 1886, an assessment of fifteen (15) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, S. S. Sweet, No. 609 Market street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the eighteenth day of October, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fifth day of November, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

S. S. SWEET, Secretary.

Office, No. 609 Market street, San Francisco, Cal.

Humboldt Gold and Silver Mining Company, Sierra District, Humboldt County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twelfth day of September, 1886, an assessment of two dollars (\$2) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, S. O'Hara Taffee, No. 430 California street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the first day of November, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twenty-seventh day of November, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

G. O'HARA TAAFFE, Secretary.

Office, No. 430 California street, San Francisco.

I. X. L. Gold and Silver Mining Company, Silver Mountain District, Alpine County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-ninth day of September, 1886, an assessment of one dollar and fifty (\$1.50) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary only, at the office of the Company.

Any stock upon which said assessment shall remain unpaid on the thirtieth day of October, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twelfth day of November, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JAMES C. DAYLEY, Secretary.

Office, No. 333 Montgomery street, San Francisco, Cal.

Keystone Mining Company, Copper Canon District, Copperopolis, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighth day of September, 1886, an assessment of five (\$5) dollars per share was levied upon the capital stock of said Company, payable immediately, in gold coin of the United States, to the Secretary, at his office, No. 440 California street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-second day of October, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the tenth day of November, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. P. SUTTON, Secretary.

Office, 440 California street, San Francisco.

Kentucky Copper Mining Company, Calaveras County, California.

Notice is hereby given, that the certificates, No. 44 of fifteen shares, and No. 109 of ten shares, Kentucky Copper Mining Company, standing in my name, have been lost. The transfer being stopped, the public are cautioned against purchasing the same.

J. R. DENNIS.

San Francisco, August 20, 1886.

La Blanca Gold and Silver Mining Company, District of San Antonio, Soconusco, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of October, 1886, an assessment of one dollar and fifty cents (\$1.50) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, 318 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the eighth day of November, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the sixth day of December, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOISE, Secretary.

Office, 318 California street.

Mina Roca de las Flores Mining and Mill Company, Camp Flores, near West Point, Calaveras County, California.

Notice.—There are delinquent, upon the following described stock, on account of assessment (No. 13) levied on the twenty-first day of August, 1886, the several amounts set opposite the names of the respective shareholders, as follows:

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; a, Dies; c, Shoes, and o, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan when properly constructed, are respectively 177, 118 and 132.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes direct from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been furnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works.

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

YOUNG MEN WANTED!

Pacific Business College!

51 Market street, between Third and Fourth,
SAN FRANCISCO.

AN INSTITUTION DESIGNED TO PREPARE YOUNG and middle-aged men far an active and successful business life.

BOOK-KEEPING, PENMANSHIP, COMMERCIAL LAW, COMMERCIAL ARITHMETIC, CORRESPONDENCE, MODERN LANGUAGES, Etc.,

Practically taught.

This College forms a link of the

American Chain of Commercial Colleges,

Located in the principal cities of the United States, and is the only institution on the Pacific coast conducted on actual BUSINESS PRINCIPLES.

Regular Banks and Business Offices have been introduced,

By which we are enabled to fit out Students in the BEST POSSIBLE MANNER, and at the LEAST EXPENSE of time and money, for the practical duties of the Counting House.

Students can enter at any time of the year, there being no vacations. Each student receives individual instruction, with the exception of Lectures and other general exercises.

The College Review,

Giving full particulars of the College, can be had FREE, by calling at the College, or addressing

Book Printing should be considered and treated as one of the higher branches of the "Art of Arts," and its execution entrusted only to experienced and intelligent workmen. Strict attention will be given to all orders for BOOK AND PAMPHLET PRINTING entrusted to the Mining and Scientific Press Job Office.

The Mining Press comes loaded with a rich variety of mining intelligence, and all sorts of scientific interesting matter.—[Amador Ledger.]

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the

PACIFIC FOUNDRY,

1v1 San Francisco.

LEFFEL'S American Double Turbine

THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given unusual satisfaction whenever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These Wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 500 feet fall. Let us know how much water you have either in miner's inches or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to KNAPP & GRANT, —ALSO— San Francisco.

Leffel's Lever Jacks, For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks, for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind. For sale by KNAPP & GRANT, 12v12-3m San Francisco.

PAGE'S PATENT FOR RAISING SUNKEN VESSELS!

SHIPPING AND INSURANCE COMPANIES, AND other parties upon this Coast or in the Atlantic States, having occasion to raise themselves of this invention, which has been tried and proved a success, will please address for the present, JOSEPH DE VINCEY, San Francisco at the office at the Mining and Scientific Press. 8v13

AUSTIN Z. PAGE, Patentee.

To Ditchmen, Millmen and Others Requiring IRON PIPE.

M. R. ROSE, CORNER OF 9TH AND K STREETS, Sacramento City, has facilities unsurpassed on this coast for the manufacture of IRON PIPE of every description. He also has on hand a deep well FORCE PUMP, of his own invention and manufacture, well adapted for all wells. His tools being portable, pipe can be manufactured on the ground. 19v12

It tells us truly the Minute, Hour, Day of the Week and Day of the Month.

HORTON'S PATENT CALENDAR CLOCK!

MANUFACTURED BY THE

ITHACA CALENDAR CLOCK COMPANY,

Ithaca, N. Y., and for sale by

W. J. EGBERT, Agent,

At JOB M. SEAMAN & CO'S, 631 WASHINGTON STREET, San Francisco.

THIS TIME PIECE costs but a trifle more than any other good clock, and is just the article for every well-regulated business house, office, saloon, or, in fact, any place where a handsome, perfect time-keeper is daily appreciated. The clock has two dials, the first being the same as an ordinary clock; the second has but one pointer, and shows the day of the week, the month and day of the month. It is arranged to mark the days in leap years with equal regularity. It is an eight-day piece, and runs from year to year without change. It can be examined at the Office of the Mining and Scientific Press. 2v13p16-1f

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms: Na. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price \$600 No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour. 850 No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour. 1,300 The above Crushers have been recently erected and are now successfully employed at Bear Valley, Marin county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above Improved Barrel, are hereby informed that on and after the 1st November, 1866, the royalty charged for using the same will be raised to the sum of \$100 per Barrel.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers. A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866. BRODIE & RADCLIFF, Express Building, 402 Montgomery street, San Francisco. 12v131f

REMINGTON'S ARMORY.

Agency, 310 Washington st., San Francisco.

PRICES REDUCED!

These arms have been preferred by the United States Government, and stand unequalled by any in the world. Revolvers, Army, Navy, Belt and Pocket, Double and Single Action, Repeaters, and vest-pocket Pistols with copper ammunition; Police Revolvers, a new model, navy size ball, 4 1/2 to 6 inch barrel; Rifle Guns—an entirely new Arm—having a range and accuracy equal to a rifle, and a most perfect Camo. All the new models for sale very low. 12v131f

ALBERT E. CRANE.

Its correspondents are men of science and learning, and hail from all parts of the coast. It is published at San Francisco, at \$5 per annum, or \$3 for six months. Address Dewey & Co., publishers of Mining Press, San Francisco [Nye County News.]

Union Amalgamator.

This Valuable Invention

ITS FAST FINDING ITS WAY INTO GENERAL USE, NOT by means of combination of capital and influence, but on the strength of its own merits, and upon the principle that what is known to be good will be appreciated. Practical men acknowledge the UNION PAN to be scientific, the best, the cheapest, and most profitable. It now stands first on the list of all pans in use for the purpose of

Working Gold and Silver Ores.

It has been found that a low class of ores, also tellings from Mills, Sulphurets, etc., that will not pay to work with the common pans, may be worked with this and obtain large profits. The UNION PAN is manufactured in two sizes, and capable of operating upon large quantities of ore in the most efficient manner.

Parties interested in Quartz Mining, Mills, etc., will find it to their advantage to call and examine for themselves, and see its operation. Gold and silver ores tested by regular mill process, at moderate cost, by

STRONG & CO.,

San Francisco Foundry, corner Mission and Fremont streets, where orders will receive prompt attention. 15v12-3m

BRUCKNER'S Mechanical Roasting Furnace

AWARDED A

PREMIUM SILVER MEDAL

—BY THE—

The Mechanics' Institute.

THESE FURNACES ARE NOW MANUFACTURED AFTER an improved mode of construction, which GREATLY SIMPLIFIES THEIR OPERATION, and afford a much larger oxidizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

THE IMPROVED FURNACE

May be seen in operation, for desulphurizing or roasting and chloridizing, at Central Mill, Virginia City, Nevada.

Parties wishing to erect such furnaces, are requested to leave their orders with

T. KALLENBERG,

19v12

416 Market street, San Francisco.

Kerosene and Gas Stoves.

TEA AND COFFEE BOILERS, GLUE POTS, OIL CANS, Etc., etc.

ALL The Cooking for a family may be done with Kerosene Oil or Gas, with less trouble, and at less expense, than by any other fuel.

Each Article manufactured by this Company is guaranteed to perform all that is claimed for it. Send for Circular. LIBERAL DISCOUNT TO THE TRADE.

KEROSENE LAMP HEATER COMPANY, 206 Pearl Street, New York. 6v13-2m

Rubber Belting, WITH COTTON FILLING.

A FULL ASSORTMENT OF 3 AND 4-PLY, NOW IN store and for sale by THOMAS H. SELEY & CO., 23v12 3m Nos. 116 and 118 California street

HYDRAULIC HOSE MANUFACTORY.

THREE SEAMS SEWED WITH TWENTY-PLY TWINE, and guaranteed to stand the pressure of 100 to 200 feet fall. One to three-ply Hose made. All orders punctually attended to.

S. HOWARD,

326 Davis street, San Francisco.

Being a PRACTICAL MACHINIST, and giving my personal attention to the execution of orders, I can guarantee the BEST class of work at the LOWEST PRICE in the city. Refer, by permission, to—

Governor F. F. Low; C. T. Meader, Stockton; Geo. K. Gloyas, Chief Engineer of Cal. S. Nav. Co., San Francisco; J. W. Stowe, Russell & Erwin Manufacturing Company; Office, No. 120 Grant street, San Francisco. 4v12

Economy in Advertising.—The MINING and SCIENTIFIC Press is the best and most economical mining advertising medium in this city. Our terms are less than any half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

AN IRON MOUNTAIN IN SWEDEN.

Sweden, which has long produced some of the best iron in the world, has also its "Iron Mountain," as well as America. Indeed, the Iron Mountain of Sweden is both larger and richer than that of Missouri. Its ore yields 72 per cent. of metallic iron, somewhat higher, we believe, than the American iron mountain. The first indication which the traveler has of his approach to this mountain is the fact of the unreliability of his compass, which becomes useless for two or three days before reaching it, over the slowly traveled mountain road. Mr. Gladstone, the English statesman, in describing his visit to the locality, says that upon his party arriving at the foot of the mountain, they "walked for hours and hours upon nothing but masses of iron ore, perfectly bright like steel." We are inclined to think the distinguished traveler must, in the above quoted remark, have slightly exaggerated what he saw; else the climate there must be so very peculiar that its atmosphere will not exert its usual oxidizing influences upon a mineral so sensible to the action of moisture as iron. The mountain is no doubt very similar in appearance to our "Pilot Knob;" but it has the great drawback of being situated in a very high latitude, in Swedish Lapland, some one or two degrees above the head of the Gulf of Bothnia, and just within the Arctic Circle. Measures are being taken, however, to overcome the natural obstacles against the development of this wonderful mineral production, by constructing a railroad to connect it with tide water. In time, no doubt, the Pilot Knob of Sweden will be to the Old World, what the Pilot Knob of Missouri is to the New World. Each can supply its respective continent with all the iron that will be wanted for many centuries to come. Both may be considered as among the great natural wonders of the world.

MINING IN AUSTRALIA.—The returns from the gold fields of Australia for the first six months of the present year, compared with the corresponding period of last year, are stated as follows:

	1876.	1865.
Western Division.....	60,362	75,424
Southern Division.....	43,909	60,686
Northern Division.....	19,032	0,014
Totals.....	114,233	143,124

Showing a decrease this year of 28,801 ounces, equal to \$492,816.

AUCTION HOUSE.—Messrs. Olney & Co. have opened a General Auction and Commission House, No. 418 Montgomery street—a very central and convenient location. Mining and other Corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Besides every kind of auction business, this firm will pay special attention to the purchase and sale of real estate in Oakland.

**STOCK CERTIFICATES,
STOCK TRANSFER JOURNALS,
STOCK LEDGERS,
ASSESSMENT RECEIPTS,**

And all other Blanks, Blank Books, etc., required by Mining and other Corporations, kept on hand or printed to order on short notice, at moderate prices, at the office of the MINING AND SCIENTIFIC PRESS.

**Notice to Miners,
Well-Borers and Water Companies.**

M. PRAG is now prepared to manufacture Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG,
813-17 Stove Store, No. 125 Clay street, below Davis.

CAUTION!

NOTICE.—TO WHOM IT MAY CONCERN.—THE PUBLIC are hereby notified that a patent was allowed Dec. 27th, 1864, and issued June 27th, 1865, to Professor Henry Wurtz, for the use of Sodium and Amalgams thereof with quicksilver, in the extraction of precious metals from their ores. All persons using said Amalgams, or purchasing or selling Sodium or said Amalgams, for use in the treatment of gold or silver ores, are hereby cautioned that they will be prosecuted to the full extent of the law.

SODIUM OR MAGNETIC AMALGAM.

THE WURTZ AMALGAMATION COMPANY,

OF NEW YORK,

Assignees of letters patent granted to Prof. Henry Wurtz, the discoverer of the use of Sodium in the amalgamation of gold and silver ores, having established an agency in San Francisco, now offer to the mining community their amalgams, with full directions for their use, on the MOST LIBERAL TERMS. A large supply of the Amalgam, of any required strength, constantly on hand.

The terms and conditions upon which rights to use the process are obtainable, can be had on application to WM. SLOSSON, Agent of the Company, Union Iron Works, corner of First and Mission street, San Francisco. 5v13

NEW YORK PRICES.

AT EXTREMELY LOW PRICES.

J. R. MEAD & CO.,
Cor. of Washington and Sansome streets.

THIS CUT REPRESENTS AN AMALGAMATOR AND SEPARATOR that has stood the test of many years' practical working in the gold mines of California, and for nearly the same time in the silver mines of Nevada, having been introduced into the first steam mills built in the then Territory, since which time they have been successfully working against all competition.

The great advantages these Amalgamators have over any others, are—

1st. Much less Cost.

2d. They do not "flour" the mercury, and collect any that may have been "sleeked" in the battery or grinders.

3d. The "sloshing" motion given to the pulp (by the revolution of the runner under the "sluiceway frame") against the amalgamated copper plates that are fastened to the frame, and by this means catching the fine gold and mercury that will not settle.

4th. The gate in the cone, through which the pulp is discharged, from the top, and where there is the least motion, almost precluding the possibility of any granulated mercury or fine gold escaping.

There are over 500 of them in use in California and Nevada, where those interested can see their practical workings.

ISRAEL W. KNOX, or
W. A. PALMER, Inventors,

ANNUAL REPORT

—OF THE—
Pacific Insurance Company.

IN COMPLIANCE WITH THE ACT OF THE LEGISLATURE of the State of California, entitled "An Act concerning Corporations," passed April 22, 1860, the Pacific Insurance Company of San Francisco makes the following Annual Report:

I.—The amount of the Capital Stock of this Company is SEVEN HUNDRED AND FIFTY THOUSAND DOLLARS, and paid in GOLD.....\$750,000
II.—The amount of the Assets is ONE MILLION AND FIFTY-ONE THOUSAND, FOUR HUNDRED AND TWENTY DOLLARS AND THIRTY-SEVEN CENTS. \$1,051,420.37
III.—The Company has NO DEBTS.

IV.—The amount of insurance effected during the year, and which remained in force December 31, 1865:

Marine.....\$12,973,949

This Company commenced underwriting Marine Risks, August 1, 1865.

V.—This Company insures against the following risks, viz.: BUILDINGS, HOUSEHOLD FURNITURE, MERCHANDISE, RENTS, LEASEHOLDS, VESSELS IN PORT AND THEIR CARGOES, and other PERSONAL PROPERTY, AGAINST LOSS OR DAMAGE BY FIRE.

Also, on CARGOES, TREASURES, COMMISSIONS, PROFITS, and WAR RISKS, and ON ALL MARINE AND LAND NAVIGATION RISKS, TO AND FROM ALL PORTS IN THE WORLD.

VI.—This Company will take on any FIRST-CLASS RISK not to exceed \$75,000 (the limit fixed by law), and on all large risks will reimburse to an extent consistent with PRUDENCE in other RESPONSIBLE COMPANIES.

Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make.

HOADLEY'S.

FOUR SIZES,

8, 10, 12, and 15-Horse Power,

HOADLEY'S.

3 to 40-Horse Power.

HITTINGER'S.

THREE SIZES,

5, 7, and 10-Horse Power

HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price. These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.

Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with an without carriages.

Also, Portable Saw and Grist Mills.
For sale by **TREADWELL & CO.,**
18v12 Corner of Front Market and streets.

MILLER'S ADJUSTABLE TEETH FOR SAWS.
There is scarcely a tool used in the mechanics' arts of more practical utility than the circular saw. Notwithstanding their high cost and the daily expense incurred in keeping them in order, they are used without limit. Formerly all saws were made by forming solid teeth on the periphery of the plate. Teeth thus made do good work, but are liable to be, and frequently are, broken off. There is no means of restoring them when broken, except by reducing all the other teeth to the same radius.

A patent has recently been allowed to Mr. W. P. Miller, of this city for saw teeth constructed upon an improved plan, which are claimed by the inventor to possess the following advantages over all others: The teeth, being nearly encompassed in the plate, are rendered immeasurably stronger than even solid teeth formed on the plate; for reason of their great stiffness laterally, these saws may be fully one-fourth less in thickness than solid teeth, and one-third less than other insertable teeth saws; these teeth are self-attaching and adjustable in their sockets, thereby differing from any other saw teeth; should the point of one or more of them become broken, by simply turning them forward in their sockets they will attain the necessary projection, then file them and the damage is repaired; these saws remain exactly the same size, and never can get out of round nor balance; these improved teeth are elastic, which insures a perfect fit, and a uniform distension in their sockets under any degree of temperature; ninety-five per cent. of the labor and files required to keep a solid tooth saw in order, or fifty per cent. as compared with other insertable teeth saws, will be saved by the use of these adjustable teeth; they cannot, by any means, be thrown out of their sockets, and hence the operatives are secure from injury; these adjustable teeth will do three times more work before being worn out than other insertable teeth, for the reason that the teeth remaining in order need not be reduced to accommodate those that may be dull or broken; they are alike applicable to circular saws of every size and for all purposes, and are peculiarly adapted for cutting-off saws, as well as for splitting.

The teeth are held firmly in position by friction in a V groove. Letters patent were issued for this invention in September, 1866.

Judicious Resolutions.

Several of our most substantial and judiciously managed mining corporations have passed resolutions, since the approval of the new assessment law, requiring all notice of assessments and sales to be published in the MINING AND SCIENTIFIC PRESS, the only thorough (daily or weekly) mining journal on this coast. Our efforts to concentrate all mining advertisements in one paper, for the economical convenience of shareholders and assessment payers, are meeting with decided success. Those who believe in supporting the mining cause, should bear our paper in mind, and bring up this subject at the next trustee or shareholders' meeting.

WORDS FOR MINERS.—The Gold Hill Daily News, Nevada—a medium of good authority—says thus:

The MINING AND SCIENTIFIC PRESS is a weekly journal, published in San Francisco, which is entitled to the subscription patronage of every practical miner in Nevada, and every person interested in Nevada or California mining operations. It is a well gotten up sixteen-page quarto; and its reading would tend vastly to the particular "posting" and general enlightenment of our sort of working folks. Subscribe for it. Five dollars a year; three dollars for six months. It should have an agency in Virginia and Gold Hill; but we see none advertised in its columns. Every new improvement in mining implements and operations are fully described by words and illustrated by wood cuts in this excellent publication. A specimen number can be seen at our office.

CONTRIBUTED FOR OUR CABINET.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

G. KUSTEL.. of this city, has contributed to our cabinet several very fine specimens of ore from the Chicago and Occidental silver mines, in Shasta county. No. 18, consists chiefly of argentiferous galena.

No. 19, is a piece of white quartz, a portion of which having the drusy appearance of the interior walls of a geode, is a beautiful, fine, spray-like deposit of copper, either the native mineral or the red oxyd, which, it is difficult to determine without a careful examination.

No. 20, is a very rich specimen of *Fahlers*, or zinc-blend and galena, highly argentiferous. Assorted lots of this ore, taken from the depth of fifty feet, are said to pay over \$1,000 to the ton.

No. 21, contains a large amount of pyromorphite, or phosphate of lead, with small crystals of carbonate of lead. This, we believe, is the first instance of the discovery of this mineral in California. Before the blow-pipe, on charcoal, pyromorphite fuses readily, and the globule, on cooling, assumes a polyhedral form, and a dark color which, in the reducing flame, becomes bluish. The mineral derives its name from the form which a globule assumes on cooling. We hope soon to be able to give some particulars with regard to the interesting developments which are being made in the district from which these specimens were received.

FERRY BOAT FOR VALLEJO.—Mr. John Lochhead, at his machine shop, on Beale street, in this city, is building the machinery for a side-wheel and double-oared ferry boat, to ply between Mare Island and Vallejo. The boat is to be seventy feet in length by sixteen feet width of beam, and oared by Mr. Maguire. Her engines will have 16-inch cylinders and 30-inch stroke.

A NEW RAILROAD ROUTE TO THE PACIFIC is talked of. Gen. John C. Fremont is said to be at the head of it. The plan is to connect the line of railroads running through the southern part of Texas, thence to Monterey, with Guaymas, in Mexico.

ILLNESS often accrues for the want of such simple medicines as are contained in Dr. Boynton's medicine chests, advertised in this paper.

RICE & MILLER'S PATENT SELF-LUBRICATING JOURNAL BOXES.

Any device which can be readily attached to a journal, and which shall be self-lubricating, must be a great desideratum. This, it is claimed, is accomplished in the device which we are about to describe. The self-lubricating journal is designed for shafting and many kinds of machinery. In order that its construction and operation may be fully understood, we give the subjoined illustrations.

Fig. 1.

A, fig. 1, is a shaft. B, is the hanger. C, C, the cap. D, D, the hoods fitting over the extended ends of the reservoir. E, E, a bead through which slides a pin to fasten on the hoods. F, F, is the reservoir and dipper combined, which is movable from and without disturbance of the box, by taking out four small screws; is easily removed to be cleaned out.

Fig. 2.

Fig. 2, is the box with one hood left off with the shaft withdrawn. A, the extension of the reservoir. B, the inner lower half of bearing surface, showing a portion of the lubricator at the bottom of the box. C, the end of shaft. D, D, the cap. E, E, the bead through which slides the pin to fasten the hoods. F, the hood in position.

Fig. 3.

Fig. 3, shows the lower half of the box with the reservoir attached. A, A, the extension of the reservoir. B, the bearing surface or Babbit metal. C, C, the lubricator lying on the top of the lower half of the box in a space of one-eighth of an inch between the box and cap. The lubricator is made with tail-pieces leading down through the oil passages made directly through and in the body of the casting to the oil reservoir below, taking the oil up by capillary attraction, and returns the oil up by the opposite side back to the reservoir,

making a continuous circulation. This lubricator can be replaced without disturbance of the shaft or box. The lubricator at the bottom is the one most commonly used, lying in a channel or groove below the bearing surface, laced through small holes and tied underneath. D, D, is the swell around the box in the center to give it proper strength.

The frequent oiling required with journal boxes constructed after the usual manner, the waste of lubricating material, the difficulty of keeping the dust from the same, and the necessary lack of cleanliness involved in their use, are objections familiar to every mechanic. When to these we add the constant danger of the bearings running dry and thereby becoming heated, etc., the advantage of a device which will accomplish what is claimed for the one above illustrated, must be at once appreciated.

By carefully reading the above, it will be seen that this invention consists merely in the peculiar construction and arrangement of the journal box, which constitutes both a bearing and a reservoir, from which just the quantity of oil which may be needed from hour to hour, will be constantly fed directly upon the journal. By this arrangement there must be a large economy in the consumption of oil over the usual style of boxes. It is claimed that circular saws, which make from three to five thousand revolutions per minute, can be as readily and uniformly lubricated by this device, as one that does not exceed fifty revolutions. The inventor and patentee is M. J. Rice, 1,211 Washington street, Boston, Mass. A diploma was awarded for the invention by the Massachusetts Mechanical Association, in September, 1865.

THE GOLD FIELDS OF NEW ZEALAND.—The island of New Zealand seems destined to occupy a prominent position as a gold producing region; indeed, a mighty change, both political and industrial, seems to be in store for it. The sand on its sea shore; the rivers flowing from its interior, and its mountain ranges everywhere seem to abound in gold. The Hokitika diggings, which at last accounts had been worked for a few months only, had already turned out three and a half millions of dollars; \$720,000 had been returned for a single month. At one point the sea beach for miles was one continuous placer, where the miners were reported to be taken out from \$25 to \$100 per week to the man. Gold is found all the way from the sea to snow line on the mountains. The total value of gold exports from New Zealand up to June last is set down at \$38,234,000. The entire area of both these large islands is believed to be auriferous, although but a small portion has as yet been prospected.

IRREPRESSIBLE.—W. T. Garratt, whose brass foundry was pretty much destroyed by the fire at the corner of Market and First streets on Thursday morning of last week, immediately rented another shop at the corner of Mission and Fremont streets, whither he had commenced moving the goods, machinery, etc., saved from the fire, before three o'clock of the next (Friday) afternoon. On Saturday he was "at home" again, and ready to attend to business.

QUICKSILVER PRODUCT.—In our last issue we gave the yield of this New Almaden mine, since January last, at 16,700 flasks of quick-silver, quoting the figures of a cotemporary. Since then the *Mercantile Gazette* has obtained information which justifies the assertion that the yield could not have been less than 30,000 flasks. The following are the receipts per month from the New Idra and the New Almaden combined, since January last:

	Flasks.
January.....	4,524
February.....	3,584
March.....	4,567
April.....	2,536
May.....	2,877
June.....	3,415
July.....	3,830
August.....	3,779
September.....	3,491
Total.....	32,693

This product of the New Idra is inconsiderable. The Reddington Lake Manufactory is producing, we believe, an increase over last year, while the Guadalupe mine is producing but little. Of the yield of these two latter we make no estimate for the past nine months, as their agents in this city have been requested by the large contract buyers to withhold all information on the subject. The present price is sixty cents per pound.

NEW SHIP CANAL PROJECT.—On the 27th of last June, the Congress of Columbia passed an Act in favor of the construction of a ship canal across the Isthmus of Darien and Panama. The enterprise is open to the competition of the world. The privilege is granted for ninety-nine years, and the work is to be completed in ten years. The United States steamer *Waterloo* recently arrived at Panama for the purpose of receiving on board a party of scientific gentlemen who are about to renew the survey of the route. They are to be conveyed to San Miguel, and the vessel is understood to have been placed at their disposal until the survey is either completed or abandoned. The party is said to have been organized under the auspices of a prominent Senator from Rhode Island.

FILE MAKING.—Messrs. Durning and Fisher have recently opened an establishment in this city for file making and re-cutting. They cannot fail to do well. The increasing demand for these indispensable implements which is created by our extensive machine works, will be sure to make their enterprise a profitable one. Thousands of old files which have been thrown aside as worthless will now be re-cut. We understand that there are but few persons in this State who are acquainted with the business of file cutting. The establishment is on Pacific street, between Market and Mission.

PERSONAL.—John Arthur Phillips, Esq., the distinguished English metallurgist, who visited California about a year ago, arrived here by the last steamer, on his second visit to the Pacific coast. He is now in Nevada county, examining some of the rich mining developments in that region. He comes hither, at this time, in the interest of English capitalists. Mr. Phillips is well known among metallurgists and miners as the author of a "Manual of Metallurgy," and several other valuable works on metallurgy and mining.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

From Grass Valley, Nevada County.

WORKING AND TREATMENT OF ORES.

EDITORS PRESS: Much as I have heard of Grass Valley, I was fairly astonished at the extent and flourishing appearance of this town. It is said to be slightly overdone at present, but a short walk among the mines and mills will convince anyone that prosperity here rests upon a solid foundation.

I have been repeatedly assured that the success which has attended mining enterprises here, is in a large measure due to the fact, that all complicated and costly machinery, "processes" and "process men," have been persistently ignored by owners and workers of mines. Certainly the means and appliances for saving gold in most of the mills I have visited, are characterized by extreme simplicity. Wet crushing and amalgamating in the battery, copper plates, blankets, riffles, or ripples of various kinds, "porcupines" and plenty of water are the means most in favor; and these are so multiplied and extended, so many opportunities are afforded the gold to make the acquaintance of mercury, lying in wait in many cunningly-devised recesses and little shining pools, that really it seems not much is left to be desired, so far as free gold is concerned. The plan appears to be, to put through as many tons as possible consistently with saving the greater portion of the gold. The sulphurets are more or less perfectly separated from the tailings by means of rockers, which, though usually operated by machinery, must require a good deal of attention.

No doubt the millmen have done what they thought best for their own interest, and considering the many absurd and impractical machines, and more absurd and impractical processes, which are continually thrust before the mining public by ignorant quacks and twaddling theorists, each of whom asserts that his own particular bantling is the one thing necessary to ensure success, they can scarcely be blamed for giving the cold shoulder to all who assume to teach them their business, whether it be a celebrated professor who will gravely tell them "if you should sink a shaft here, you might strike a large vein, and if it should prove to contain gold, it would be a good thing," as it is related one did, or an enthusiastic vendor of some patent machine, which he desires to hitch on to the tail of your mill in order that it may "prove itself."

Nevertheless, it is an indisputable fact that a very large quantity of gold is daily lost; and now that many of the mines are paying so largely that their owners can afford to expend a few dollars in experimenting, it would be well to give some attention to the means by which a portion of this loss may be avoided. As matters go, the mines are being in a great measure wasted. True they, at least many of them, pay their owners well; but they would do so none the less by a more careful system of working, and great good to the public would result.

I heard a millman say, "I would not spend five dollars to get five!" I think he is wrong. If a man, by a day's work, can produce what that day's work is worth, somebody is benefited thereby. But I believe many would go further, and would not spend four dollars and a half to get five. The millmen know they are losing gold, but I believe if they had any idea how much they lose, they would exert themselves to do better work. I can point to a mill which is supposed to be, and doubtless is, doing as good work as any, this tailings from which, after extracting as nearly as possible all the sulphurets, contain from \$12 to \$20 per ton in gold! Many mines are worked with profit, the ores of which are less rich. The gold is locked up in the grains of quartz, and is therefore not "free," but would be if those particles were reduced to fine powder. A Mexican would laugh to scorn the "beneficia-

tor" who should allow his metal to pass from his hands in so coarse a state as is here seen.

One large mill here has a very efficient set of grinders, through which the pulp from the battery passes, and then they go to the other extreme, supposing that fine grinding is all that is needed to extract gold from sulphuret, as well as quartz, which is a great mistake, notwithstanding I know of several persons who maintain the theory. Pulverization will extract gold from quartz, and should be carried just so far as it will pay; but no amount of simple trituration will get it out of sulphurets.

I have said that the sulphurets are saved from the tailings by washing on common rockers. The process is quite imperfect. I have taken a cup full of water from the ravine, hundreds of yards from whence it came, and after passing several sets of rockers, it was almost clear; yet held in suspension numberless particles of sulphurets, which I collected and treated with acid, when the fine gold became plainly visible. Here comes in a fact which, though well known to English tin-washers, is little acted on here. Finely divided sulphurets cannot be saved in washing coarse sand. The effect of size and form, in a current of water, counteracts that of specific gravity. This matter must be divided into different grades of fineness before washing, and then the concentration can be effected better and cheaper, by some of the machines in the market, than by these old fashioned rockers.

The sulphurets saved are either sold to the Swansea agents, or worked at so much per ton by local "sulphuret men," who treat them by Plattner's chlorine process, which, by the way, some of them have facetiously pretended was a patent process of their own. These gentlemen have of late been sorely puzzled by the discovery that the sulphurets of a certain mine could not be treated successfully in that way, and many were the conjectures as to the cause thereof. Some said lead, and as a remedy prescribed sulphuric acid; others thought lime was to blame, but examination failed to show the presence of either. Probably the gold in these sulphurets is too coarse to be profitably so treated. As they are quite rich, I would suggest smelting as being worth a trial. In the residues from some sulphuret works I have been able to see gold by the aid of a pretty good lens, and a sample of a large pile gave, by fire assay, \$23 in gold to the ton.

The Pacific Ore Company is experimenting on Hagan's method of desulphurizing ore before crushing, in which decomposed steam is the accredited agent. If successful the process will be invaluable, as it will enable the extraction of nearly the whole of the gold by simple amalgamation, while the gangue will be so softened as to almost double the effective working power of machinery, thus opening the way to that fine grinding which is so necessary, while avoiding, or at least abridging greatly, the tedious treatment of the sulphurets. It is thought that the extra cost of this treatment will not exceed two dollars per ton. I am watching the result of the experiment, and will inform you of it.

I have been very much surprised in reading late numbers of the Press, to find that it was not generally known to the miners of California and Nevada that gold and silver were to be found in connexion with carbonate of lime.

In the State of Sonora, Mexico, calcareous gangues are very common, and in the district of San Antonio, Lower California, I have worked ores from a dozen different silver mines, in almost all of which lime is the predominating constituent of the veinstone. Manganese also is nearly always present. I have seen a piece of hornblende from Arizona which was full of bright spangles of gold. It had been brought as tin ore.

The nature of the gangue is an important consideration in the treatment of ores.

CHARLES H. AARON.

Grass Valley, Cal., Oct. 9, 1866.

THE Calaveras Chronicle gives the following account of an explosion which occurred in the claim of Squires & Co. last week:

A shaft 160 feet in depth has been sunk on the claim, and a tunnel 250 feet in length run from the bottom of it. On Tuesday the workmen broke through into a drift which was run a number of years ago, the mouth of which had caved down so as to be air tight. Desiring to examine the old diggings, one of the men held his candle to the orifice between the drifts, when the gas or foul air which had been so long confined, exploded with such force as to knock the men senseless, burning their woolen shirts to a crisp, and blowing the roof off the shed over the whim, although it was 410 feet distant. The men were terribly burned and otherwise injured, but it is thought they will recover.

A HUMAN red blood globule measures something less than the 1-5,000th part of an inch. One-fourth of this globule will give a distinct characteristic line in the micro-spectroscope.

SODIUM AMALGAM—FURTHER EXPERIMENTS.

This American Journal of Mining gives some further extracts from the papers read by Professor Wurtz, before the Buffalo meeting of the American Association for the advancement of Science.

The following letter from Prof. Silliman, relating to trials on a working scale, instituted under his advice and direction, at some mills in this State and Nevada, was submitted to the Association:

NEW HAVEN, Feb. 27, 1866.

PROF. HENRY WURTZ: Dear Sir—I have received advices under date of January 17 and 27, 1866, from Dr. Fisher, in Grass Valley, California, the gentleman I requested to put to the test your new sodium, and find therein the following passages bearing upon your inventions: Under date of Jan. 17th:—"Upon applying No. 1 amalgam directly to the clean copper plates, they amalgamate easily and retain their coating better than when coated in the ordinary manner. There were cleaned up after six days' run, from the plates coated with magnetic quicksilver, 15 dwts of amalgam, while the five plates coated in the usual manner cleaned up but 13½ dwts. The plates were of the same size, had never been used before, and were coated at the same time. They were placed side by side in two slices, each fed from the same battery, and in all respects the conditions were made as nearly alike as possible. As I advised you in my last, the 'Eureka Mill,' for any other in which the 'blanket process' is employed, cannot give the sodium amalgam a fair test so far as its value in saving gold on an incline is concerned; for ninety per cent. of the total gold saved is detained by the blankets. * * * Parties have been experimenting in Nevada for some time past with sodium. At the Gould & Curry mill, they tried sodium amalgam in the Hepburn pan (1,000 lbs. charges of ore) with very satisfactory results. After running six hours at a temperature of 150°, the contents of the pan were run off, and the yield of silver was ten per cent. greater than when operating as usual. Mr. Attwood tells me that his son, amalgamator at the Ophir mill in Virginia City, has obtained still better results with the Freiberg barrel." * * * Under date of January 27, 1866: "It seems to me that the great value of sodium will prove to be in pans and barrels and on copper plates. Last week, in my experiments at Eureka, the gold amalgam from the plates coated with sodium amalgam weighed seventy per cent. more than that from plates coated in the usual way. * * * (Signed) 'Yours truly, B. SILLIMAN.'"

The following is the substance, greatly condensed, of a report by Dr. John Torrey, of experiments upon ore from the "Moss Lode," Arizona:

U. S. ASSAY OFFICE, N. Y.,

February 28, 1866.

PROF. H. WURTZ: We herewith send you the results of our experiments on the comparative value of the new method of amalgamation invented by you, and the old method with ordinary mercury. The ore operated on assayed: Gold, per ton (2,000 lbs.) \$1,072.00; silver, \$30.

First Experiment—A quantity operated on by amalgamation in the ordinary way, and the slime treated laboriously for sixty minutes to collect the gold amalgam yielded: fine gold, per ton \$470; equal to forty-five per cent. of the fire assay.

Second Experiment—Another equal quantity, all else the same, except the sodium amalgam, was used, forty minutes only being occupied in separating the gold amalgam from the slimes, gave: fine gold, per ton, \$817.50; equal to seventy-eight per cent. of the fire assay.

Third Experiment—The tailings, from the first experiment (much having been lost, however), amalgamated with the aid of sodium, yielded: fine gold, per ton, \$134, or fourteen per cent. additional of the fire assay. These results, and not a few others of a similar kind, show, conclusively, the efficacy of your new mode of amalgamation, and its great superiority over the usual method in which ordinary quicksilver is used. Yours respectfully,

JOHN TORREY.

A GOOD EXAMPLE.—The Plumas National states that in addition to the premium of \$50 offered by Mr. J. R. Buckbee for the best cabinet of minerals at the next County Fair, Mr. W. A. Bollinger and Messrs. Prescott & Scheidel will give \$25 each for the same purpose. These liberal offers make a total premium for minerals of \$100, and will doubtless awaken a lively competition for the prize.

If a few citizens in each county would "go and do likewise," the effect would be felt upon the business of that county; for in this way they would sooner become acquainted with their own mineral resources.

Improvements in Mining Machinery.

It is generally conceded that the great bulk of the supply of gold to be furnished to the markets of the world, must, henceforth, be obtained by the crushing and working of quartz. The quantity obtained from the placer mines, at present, does not equal that collected by the quartz mills, and this disproportion is constantly increasing, as mills increase in number and the placer mines are being worked out. Improvements in the machinery and processes for the extraction of gold from quartz are consequently subjects of general interest. There is no other branch of the national industry in which so much ill-directed effort has been devoted as in the construction of machinery for crushing quartz and saving the gold. Till quite recently, theory was the rule and practical knowledge the exception among the inventors of such machines. Millions of dollars and years of valuable time have been wasted in operating with such, worse than useless machinery. It is an undeniable and most important fact, that since the discovery of gold on this coast, more than one half as much of the precious metals has been wasted, for want of proper means to save it, than has been collected, while the greater portion of the quantity saved, has been expended in useless machinery and profitless labor. It is this state of affairs that has caused such a general indisposition among capitalists to embark in quartz mining. The costs incurred in obtaining the gold, in too many cases, being more than it was worth. But, when the machinery in our quartz mills, like that in our factories and workshops, shall be applied to saving labor as well as gold, so that the cost of extracting the metal shall not so frequently exceed the value of the product, capitalists will be as anxious to obtain interests in quartz mines as they now are to keep out of them.

Among the most important, because it is the most useful machine in operation at Rawhide Ranch, Tuolumne county, is one of Brodie's quartz crushers—a very compact, simple-working little affair, which stands on the platform in front of the batteries, where the teams dump the rock as it comes from the mine. With the aid of one man, this little machine can daily crush, to the fineness of peas or rice, sufficient rock to supply four ten-stamp batteries, thus performing more than half the work of the stamps, and saving half their wear and tear, and consequently saving more than half the cost of crushing the rock. This powerful machine is set in motion by a belt connecting it with the cam shaft, and as it requires but little power to keep it in motion, its services cost but little.

The Brodie Crusher, though constructed on somewhat similar principles to the machine introduced by Blake, several years ago, is altogether different in its operations. In this machine the power is applied direct to the movable jaw, by means of an eccentric and what is termed a radius bar, which imparts a grinding as well as a crushing motion that the hardest rocks cannot resist. There are no springs, toggles, or slender bolts about it, as there are about other crushers, consequently it is not as liable to get out of repair. It is the simplest machine in construction imaginable, and one that does not require an engineer to keep it in order. This machine, capable of thus performing half of the work of a forty-stamp mill, only costs about \$1,200. It is very portable, the largest piece in it only weighing 350 pounds; the total weight not exceeding 6,000 pounds.

It requires no argument to convince any business man in charge of a quartz mill, that whatever reduces the cost of extracting the gold, increases the profits of the owners of the mine. If a machine costing \$1,200 will break more rock in one day than six men, such a machine will not be long in paying for itself, if it did nothing more than break the rock as the men do. But, if by crushing the rock to a uniform size, it enables the stamps in the batteries to always fall on an even surface, and thus operate with more uniform effect in crushing, as well as prevents the breaking of shoes and dies, by leaving no large pieces of hard rock in the battery for the stamps to fall on unevenly. Such a machine must commend itself to every superintendent of a quartz mine who understands his business. Precisely such a machine is Brodie's Quartz Crusher, to which we call the attention of every one who takes an interest in the improvement of mining machinery.—Daily American Flag.

GOLD IN NEW HAMPSHIRE.—Arrangements for working the gold mines near Lisbon, N. H., in a scientific manner, and on an extensive scale, are nearly completed, and it is intended that stamping mills shall be in operation by the first of October. Three companies have been formed, most of the stock of which is owned in New York and Boston, by natives of New Hampshire. Several old miners have been at work at the mines for some time, and are meeting with such success that the most extravagant expectations are indulged of the ultimate yield when all the requisite machinery is in operation.—Cor. Bulletin.

Mechanical.

ELECTRICITY AS A MOTIVE POWER.

A large amount of attention is being devoted at the present time to efforts for rendering electricity economically available as a motive power. Gen. Count de Molin, an Italian nobleman, has recently constructed and put in operation a small puddle-wheel boat, which he calls *L'Electricité*. He employs sixteen of Bunsen's elements to obtain his propelling power, which, by careful measurement, has been found to be equal to one man power. The paddle-wheels are two and a half feet in diameter. If we are not mistaken, we have an electro-magnetic engine in this city that will accomplish more work with less expense of material.

Mr. C. L. Stewart, of Philadelphia, recently exhibited, at the rooms of the Free Academy of New York, in the presence of a number of scientific gentlemen and prominent mechanics, an electro-magnetic motor, of quite a novel construction, which the gentlemen present considered very promising. Mr. Stewart does not yet claim to have perfected his invention. The relative cost of the power of this machine as compared with steam, had not been fully ascertained. The *Philadelphia Mining Journal*, in noticing the exhibition of this machine, says that Professor Doremus, of the Free Academy, gave some very interesting explanations and illustrations of the power of electricity, previous to the explanation of Mr. Stewart's apparatus, and expressed the opinion that, with a suitable apparatus, electric power may be produced cheaper than steam power. Aside from the question of cost, there are other manifest advantages on the side of electricity. It is constantly and instantaneously ready for use; it produces neither smoke, flame, nor noxious gases; it is perfectly clean; it involves no danger from fire; it is entirely safe; it is noiseless. Should Mr. Stewart succeed in perfecting his apparatus, it might be advantageously substituted for horse-power in the propulsion of street cars, and, in fact, for nearly all vehicles. Especially on a subterranean road such a motive power would be invaluable. Mr. Stewart intends soon to make a public trial of his apparatus upon one of the city railroads.

A NEW CEMENT.—A late number of the *London Engineer* announces a new cement of great value, which is introduced under the euphonious title of "The Zopissa Iron Cement," which, it is claimed, is capable of joining any two solid substances, however dissimilar. Wood, brick, iron, stone, or glass, can be inseparably united with great facility. A series of experiments, witnessed by the *Engineer*, gave the following results: "Plates of glass were firmly joined, edge to edge; ordinary bottles stuck upon the wall resisted all attempts at separation till the stone yielded. Champagne bottles, cemented bottom to bottom, sustained a weight of two hundred and fifty pounds. Two bricks remained joined under a tension of three hundred and twenty-five pounds, till the brick itself fractured, but the cement remained firm. Brickwork cemented with this has the solidity of a granite slab. With paper treated with this preparation in solution, the inventor has made air and water-tight tubes, ammunition cases, coffins, and even constructed a house, one story and a half in height, perfectly wind and water-tight, which he now has on exhibition." Of the constitution of this cement, or the expense of manufacturing it, the *Engineer* makes no intimations.

A NEW ALLOY.—M. M. H. Micolon, of Paris, proposes a new alloy for the manufacture of such metal articles as bells, hammers, anvils, rails, and non-cutting tools. The alloy consists of twenty parts of iron turnings or tin-waste, eighty parts of steel, four parts of manganese, and four parts of borax; but these proportions may be varied. When it is desired to increase the tenacity of the alloy, two or three parts of wolfram are added. When the cupola is ready, the iron and steel are poured in, then the manganese and borax, and the vessel is filled up with coke.

THE HARRISON STEAM BOILER.

The Harrison boiler, according to the American *Artisan*, is now being quite extensively introduced into use, and a large establishment has been erected in Philadelphia for its manufacture. The different departments in this establishment are so arranged, that the manufacture is commenced at one end and proceeded with through its successive stages until the boiler is completed at the other; the iron received by railroad entering on the track through one door, and passing on through the works, without once returning until it leaves the other extremity in the form of boilers ready made for erection. Six tons of castings are said to be made up daily into boilers, and sent away to fill up orders, which are constantly increasing. This is indicative of quite an extensive demand.

Why is it that this boiler has not been brought into use here? On the score of economy and safety, it would be far superior to the ordinary wrought iron boiler. At least one of these boilers has been set up in this city; but we understand that it could not be made to work; for what reason we are not definitely informed. Our impression, however, is, that the unequal expansion of the joints and fastenings caused the boiler to leak so badly that it could not be used. The joints, as used in the instance referred to, were faced with intervening washers of wrought iron, and the whole screwed up tightly on longitudinal rods of wrought iron. We perceive, by the account referred to in the *Artisan*, that the sections are now put together, in Philadelphia, by male and female joints, which are so carefully turned and fitted by machinery that they are absolutely steam-tight, by mere contact of the faces of the metal. By this method the joints are also interchangeable, so that any one section may be fitted to another without alteration.

If this boiler can be made to work, why might it not be advantageously adopted upon steamships and river steamers, and more especially where high-pressure steamers are used? Two hundred pounds of steam can be carried on one of these boilers with more safety than eighty or one hundred pounds on boilers of ordinary construction; and no serious injury could arise from an explosion, as it could rarely occur that more than one or two sections could explode at once, which even then would cause scarcely any more damage than the bursting of a tube in a tubular boiler. It may, perhaps, be well for some of our enterprising mechanics to look into this matter, and see if something practicable cannot be found in it.

We notice that Messrs. Jas. Harrison and Thomas L. Saders have patented, in England, a modification of the Harrison boiler, which consists in casting together a slab, of forty spheres, united by nicks, instead of making such a slab of "units" of four spheres each, held together by bolts. Thus, numerous joints are avoided. The reason for the above change in construction is given as follows: "It appears that when the priming has been violent these joints have leaked." Our impression is that the "joints" above referred to are the face joints first used, and are not the male and female joints now employed in Philadelphia manufacture, which have only been in general use a little over one year.

A HARD CEMENT.—Take iron sponge, triturate finely and mix with sand, moistened with a weak solution of muriatic acid. The iron is oxydized by acidulated water, and the siliceous forms with the oxyd a silicate of iron, which possesses great tenacity, and is not affected by atmospheric changes, or by acid or alkaline liquids of a boiling temperature. This cement will unite, into a solid mass, stones, pebbles, etc., forming conglomerates impervious to moisture, and capable of being moulded into statues, bas-reliefs, etc. This process is simply an imitation of a process of nature, which is sometimes carried on upon a large scale, in the formation of some of the hardest rocks.

THE MINERAL wealth of England has nearly doubled within the last five years.

Scientific Miscellany.

LATE RESEARCHES ON METALS.

Although science and the knowledge of metals has made steady and most wonderful progress during the past fifty years, still it is evident that, in the study of metals and their alloys, there is much more to be learned than has hitherto been made known. Scarcely a month passes without the announcement of the discovery of some new property in some one of the ordinary metals, or some important fact connected with improvements in their manufacture. It has long been known that light is transmitted through very thin sheets of nearly all the metals; but it has only quite recently been demonstrated that light travels through gold and silver more rapidly than through a vacuum.

The porosity of metals at a high temperature is also a late discovery. It is but a short time since Deville published some very interesting papers on this subject. His experiments enabled him to show that even platinum, when highly heated, is permeable to gases. The existence of this fact is especially important to persons engaged in the manufacture of coal gas, where iron retorts are used for distilling the coal. So complete is the permeability of iron at a high red heat that an iron tube filled with hydrogen, and heated to that degree, will lose all trace of that gas in a few hours. This fact is important to chemists; but more especially important is the discovery that platinum is also permeable, for that metal has heretofore been employed in the laboratory under the conviction that its high density and mode of manufacture completely destroyed its porosity.

It is only quite recently that it has been found possible to procure absolutely pure metals of any kind, or rather that we have learned that the metals previously considered, pure were not so. We have already, in previous numbers, alluded to the extreme difficulty of obtaining pure iron; but few, even among scientific men, have ever seen iron in such a condition. Pure iron is a white metal, so soft that it can readily be cut with a knife. The changes produced in iron by the presence of even the most minute proportions of impurities, is wonderful—more marked than in any other metal; hence its adaptability to such a variety of purposes in the arts.

Staas, in his experimental researches, has spent months of time to produce even a very minute quantity of absolutely pure silver, lead, etc. Pure silver, or even iron, are worth much more than their weight in gold. Pure copper is not quite so difficult of attainment, and the smallest possible impurity can be more readily detected in this than in any other metal. This is done by means of the galvanometer. Perfectly pure copper, when presented to the magnet of a very delicately constructed galvanometer, will be slightly repellant to the needle; while if even one 50-000th part of iron be present in the copper, the needle will be sensibly attracted by it.

It has only recently been discovered that the hardening of steel has great influence on its degree of expansibility. Harden a steel bar to its maximum, and it will expand to a degree which may be represented by 84; the same piece of steel rendered as soft as possible, will only expand to 62. The knowledge of this peculiarity may be made serviceable in various ways in the arts.

While the action of sea-water on steel is 29.16, and on copper 13.85, the same action on tin is represented by 1.45, and on lead by nothing, or at most but the merest trace. This fact, and others of the same class, have recently been applied to the protection of the bottoms of iron and iron-plated ships.

Most important discoveries are reported in alloys of aluminum, by which it is rendered quite flexible and exceedingly tough; but little, however, is as yet positively known with regard them. It is known, however, that aluminum produces most important modifications in steel and iron.

Among the latest discoveries announced in

this direction, is the reported process of hardening copper by the admixture of silica, forming a silicated copper. This invention has been made by Mr. Dismors, of Sandusky, Ohio, who has taken out a patent for the same. It is claimed that all necessity for oiling journals composed of this material is obviated. The Columbus and Cincinnati railroad company, it is reported, is now experimenting with it, and if found successful, propose to give the inventor \$10,000 merely for its use on their road. The New York *Stockholder*, speaking of this invention, remarks as follows:

The value of the Ohio discovery, which has been so highly appreciated by the railway company mentioned, consists in its use as an anti-friction substance—as a bearing for shafts which revolve with great rapidity, for instance, railway car axles. A substance which will form a journal, and stand, without heating to any degree approximating fusion, the swift revolution of the shaft, is a great desideratum, not only for railroad use, but in machinery generally. We do not see that it is impossible for art to make siliceous in combination with a fusible metal serve this end. The New York Central road is using antimony for the bearings of its car axles, etc., and finds that they need quite infrequent lubrication. Everybody at all conversant with steam machinery, is alive to the annoyance and dangers resulting from the heating of journals, and an invention which promises so much as the Ohio one mentioned should be cherished and tested till its value or want of value be fully proved.

A CHEAP AND INCOMBUSTIBLE WASH.—Pine shingles, and other rough, unpainted wood-work, often becomes covered, during our California winters, with a fine, short moss, which, in the long, dry seasons which follow, is almost as easily ignited as "punk;" and a spark from a cigar or chimney, falling upon such dry moss, will often kindle a flame and put a building in a blaze. Now, a cheap and incombustible wash may be made with which to cover such work, which will not only protect the wood from the formation of the moss, which causes the rapid decay of the wood, but which will also afford a most efficient protection from fire, under ordinary circumstances of exposure to great heat and numerous sparks.

Take a sufficient quantity of good stone lime and slack it carefully in a closed box, to prevent, as far as possible, the escape of steam; after it is thoroughly slacked, pass it through a fine sieve. To every six quarts of this slacked lime, add one quart of coarse salt, and one gallon of water. The mixture should then be boiled and skimmed clean; and to every five gallons thereof, add, by slow degrees, three-fourths of a pound of potash and four quarts of very fine sand—the finer the better. Coloring matter may be added, according to fancy. Apply with a common paint-brush. This wash, if the sand be ground very fine, looks equally as well as ordinary paint, and is far more durable, besides being incombustible. It forms a hard cement, and as such will stop cracks in a roof or elsewhere. No moss will ever gather upon such a wash. It can find nothing to feed upon; and wood so protected will never decay from the surface. Two good coatings applied to bricks, will render them utterly impervious to moisture. The expense is a mere trifle. It is said that boards put upon a building, without planing, if coated with this wash, will endure much longer than if planed and covered with ordinary paint. Every farmer should cover his out-buildings and all board fences with this wash. All the outside wood-work about steam mills of every character, both roof and sides, should be covered with some incombustible and preservative wash.

METEORS.—Every one has seen meteors shoot blazing across the sky at night. An astronomer has reported the passage of an unburned meteor, which he supposes was outside the limit of the earth's atmosphere. It was a dark body moving with immense rapidity, and visible only by coming between himself and the moon. Meteors owe their brilliancy to the heat generated by friction in their passage through the atmosphere. A meteor outside of the atmosphere is a dark object, except upon that side which is turned towards the sun, when it would shine if large enough to reach our vision, with reflected light, like the moon. Such a body passing across the disk of the full moon, could be very distinctly seen.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, October 20th, 1866.

There is no perceptible abatement in the demand for money, and bankers and others are enabled to employ their available funds without any difficulty at current rates. Discounts in Bank upon first-class paper and other acceptable securities are made at 1@1¼ ¢ cent. per month, but no inconsiderable proportion of the business going is in the shape of renewals. The Savings and Loan Societies are loaning at 1¼ ¢ cent. per month, with large offerings at that rate.

Receipts of treasure from domestic sources continue up to the usual average, and thus far during the current month have amounted to \$2,650,000. A further shipment of \$500,000 on Government account was made by the last steamer, amounting in all to \$9,000,000 since January 1st.

Gold bars may be quoted at 830@840, and Silver is selling at 1@1¼ ¢ cent. discount for average parcels. Currency bills on the Atlantic are offered at 45 ¢ cent. premium on gold. Sight Drafts, payable in coin, are selling at 2¼ ¢ cent. premium, and Telegraphic Transfers are made at 4 ¢ cent. Sterling Exchange is ruling at 48½¢49¢ for best bankers' bills; Commercial do., 49½¢50¢.

The exports of Treasure from January 1st to date amount to \$36,620,184.29, and during the same period in 1865, \$34,852,469.46, showing an increase of \$1,767,714.83 for 1866.

We notice that the "Odd Fellows' Savings Bank" filed its certificate of incorporation during the past week. The design of this institution is to receive deposits from "Odd Fellows and their friends," the funds to be invested in the same manner as those of the other Savings Banks in our city. It is expected to commence operations next month, and the location of the office will be in the Hall of the Association on Montgomery street. Chas. Langley, Henry B. Brooks, H. J. Booth and others are named as Trustees in the articles of incorporation.

City Stocks may be said to be inactive, with the exception of the Spring Valley Water Co., which sold to the extent of over 200 shares, at \$58.50@58. At auction, 200 shares of this stock were sold at \$57.75—dividend of ½ ¢ cent. per month included. California Steam Navigation Co. brought 69¢68 ¢ cent. At the close we quote it at 68. A dividend of 2 ¢ cent. on the capital stock of this company was paid on the 16th inst. California State Telegraph Co. paid a quarterly dividend of \$1 per share on the 15th inst. This stock is quoted at \$35 asked. Fireman's Fund Insurance Co. sold at auction during the week as follows: 100 shares at \$10.82 per share, and 904 shares at \$10.67½. At the close we quote it at 108 ¢ cent. asked.

United States 7-30 Bonds have been dealt in to a very large amount during the past week. In the Board, the June issue realized 74½¢74¾¢, and August issue 73¾¢. At auction, \$5,000 of June Bonds sold at 74c, and \$21,000 at 73½¢. At the close we quote June issue at 74½¢, and August at 73¾¢. San Francisco Bonds of 1858, to the amount of \$500, sold at 70 ¢ cent. Legal Tender Notes commanded 70½¢70¼¢, closing at 70c asked and 69½¢ bid.

The Mining share Market has shown considerable activity during the past week, but as a general thing most stocks have fallen from our last quotations. Crown Point is the exceptional case of decided improvement, while Savage and Empire Mill and Mining Co. fluctuated a trifle beyond previously quoted figures.

Hale & Norcross continues in good favor, and from what we can learn, the yield of bullion for October will be fully as large as that of September, and that the ore shows a slight improvement. It may be quoted at \$2,000 asked.

Savage was sold at \$1,200, advanced to \$1,210, then sold at \$1,230, b 30, and closed at \$1,205, b 30. The upper stations of this mine have been yielding about 22 tons per day during the week ending October 13. On the ninth floor, North Potosi chimney, the deposit of ore is widening, and the productions of the fourth and fifth floors, in the sixth station, bring the second-class ore to its present advanced grade of about \$65 per ton. The lower breast, in the Curtis shaft, yielded 150 tons of ore during the first week of this month, and some 250 tons in all have been forwarded to custom mills from this point. During the week ending Oct. 13th, 1,258 tons of ore were extracted, the approximate value of which is given at \$52,650; allowing \$28,067 for mining and reducing the same, the sum of \$24,583 will accrue to the company. Over 400 men are now employed.

Crown Point has advanced from our last quotation, selling at \$1,000@1,015, buyer 30, then at \$1,000@1,005, closing at \$1,000 asked. In drifting east on the 300-foot level, a large body of very fine ore has been discovered. The incline from the 300 to the 400-foot station is down some 95 feet, and exhibits good ore. The first clean up, embracing about a third of the present month, yielded \$31,000 in bullion. During the week ending October 14th, 759 tons of ore were extracted from the mine, a gain of 145 tons over the previous week.

Yellow Jacket declined to \$660, then dropped to \$605, seller 3, and receded still further to \$580, closing yesterday at \$600. During the first week of the present month, three tons of first-class and 1,520 tons of second-class ore were mined. The amount of bullion produced up to the 8th instant—\$20,212.04—does not, it is said, represent the yield of the rock, but only the amount received. The principal items of expenditure for the month of September are—Labor, \$36,639; legal expenses, \$44,600; reducing ore, \$131,573. The legitimate expenses of the mine for the month of September are reported at \$198,982.

Ophir met with a rapid decline during the past week, receding from \$150 to \$105, then declining to \$97, closing at \$74. An assessment of \$6 per share, or \$72 per foot, was levied on the 16th inst., payable on the 19th. Delinquents will be advertised Nov. 19th. It is said that \$1,000,000 in bullion has been extracted from this mine within the past year and a half, and that the whole amount has been expended on the mine and in paying numerous officials.

Gould & Curry opened at \$500, buyer 30, declined to \$475@450, then dropped to \$400@410, and closed at \$400, buyer 30.

Imperial opened at \$76, advanced to \$78@80, and closed at \$77 bid. The new shaft has attained a depth of 616 feet. The receipts of bullion up to the 18th instant amounted to \$32,736, against \$25,954 during the same period in September. We understand that the developments are improving in both mines of this company, and that the mills are running to their full capacity.

Chollar-Potosi receded from \$110 to \$102, and sold yesterday at \$80, b 30. Confidence sold at \$50@45. It is said that this company have suspended operations for the present. The annual meeting for the election of Trustees will be held on Nov. 9th. Empire Mill and Mining Co. opened at \$75, improved gradually to \$80@79, and closed at \$79. Bullion was dealt in to the extent of some 200 shares, opening at \$2.50@1.75, then selling at \$13@12.50, assessment of \$10 included, and closing at \$12.50. Belcher sold, within a range of \$78@45.

Overman sold within a range of \$11.25@3.50. On the 17th inst., an assessment of \$5 per share was levied on this stock. Daney sold at \$4@3.50. An assessment of 75 cents per share was levied on this stock on the 17th inst. Sierra Nevada brought \$1.50.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday, amounted to \$342,811.75.

Any of the above Books will be furnished by return mail or express, on receipt of the price with postage added. Any other books desired will also be furnished at the lowest San Francisco retail prices.

Address, **DEWEY & Co.,** Mining and Scientific Press Office, San Francisco. 1413 lamf

PATENT BUSINESS.

We have lately associated with us in the Patent and Mechanical Department of the Mining and Scientific Press, a gentleman of superior ability and attainments, who has arrived direct from the leading patent agency in New York City, and having a faithful and reliable associate in Washington City, we are now better than ever before prepared to secure the claims of our applicants, in a careful, prompt and efficient manner. **DEWEY & Co.,** San Francisco, June, 1866. Patent Solicitors.

By Express.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co.'s tariff) on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must themselves settle the same.

JOB PRINTING

—FOR—

THE PEOPLE!

Mining and Scientific Press

JOB PRINTING OFFICE,

505 Clay Street,

(Southwest corner of Sansome street, on 2d floor.)

Formerly WATERS BROS. & CO.'S.

We are now prepared to offer customers the most favorable inducements to patronize our Book and Job Printing Establishment. Our office is supplied with an extensive assortment of Type, and the best style of Presses for good work and

CHEAP AND RAPID PRINTING.

Patrons will always find us well up to the times, ready to execute superior work, and furnish the same as cheap as any prompt and reliable firm in San Francisco.

Our aim is to suit our customers in regard to style and prices, and will guarantee entire satisfaction to every reasonable individual who may be kind enough to bestow upon us his patronage.

We give especial attention, when desired, in assisting parties in making up or revising their copy. Particular care will always be given to the publication of

LAW BRIEFS,
CERTIFICATES OF STOCK,
MISCELLANEOUS BLANKS,
BLANK BOOKS,
MINING BLANKS

BOOKS
PAMPHLETS,
CARDS,
CIRCULARS,
MINING REPORTS.

Orders from the interior will receive prompt attention. We shall take care to secure correctness in all work executed for parties out of town. Small packages can be forwarded by mail at small expense.

City customers, or persons visiting San Francisco, are invited to call and examine our specimens, when they will be politely informed of our prices by the Proprietors.

Commencement of Fourteenth Volume

— OF THE —

Mining and Scientific Press

Published Every Saturday.

The title of our journal is a truthful expression of its character.

It affords a class of progressive information to the Miners, Mechanics and Professional Men of the Pacific Coast, which cannot be derived from books, or other publications.

Each Volume comprises, in reality, a book of new intelligence and facts relating to Mining, Mechanism, Metallurgy, Science and Art, developed by our rich and peculiar resources, and identical with our own industry and history.

By the encouragement of intelligent economy in LABOR and OOLD-SAVING, we shall make the Press a source of INDIVIDUAL PROFIT to its patrons, as well as a public benefit to every local community in which it circulates.

The prospects of our journal are now brighter than at any former period. Our facilities for furnishing a valuable paper are constantly increasing.

Editorial Expressions:

Following are some of the many opinions generously expressed by our neighbors:

MINING AND SCIENTIFIC PRESS.—The paper whose name we have just written, ranks among the leading scientific journals of the world. On mining matters it certainly has no equal, and more than all other causes combined, it has advanced the interests of the quartz miners of the Pacific Coast. Its editors are men of thorough education and large practical experience, and its list of contributors embraces many names distinguished in the various fields of scientific exploration and mechanical invention. The Mining and Scientific Press ought to circulate universally among intelligent Californians, to whom we most cordially commend it, and its traveling agent, O. P. Truesdell, who is now canvassing this city and county, and will shortly visit other counties in the southern part of the State, in its interest. —[Stockton Daily Independent, Sept., 1866.]

"SULPHURETS," and "Our Lady Correspondent," of the Mining Press, have each contributed an interesting article on Mines and Mining in Andador county. Hope they will keep up the fire. One of our subscribers complains that "Sulphurets" fell into an error, in stating that the sulphurets of the middle or Jackson range are richer than those on the upper or Pae Grove. He thinks it is just the reverse. —[Amador Ledger.]

VOLUME TWELFTH.—The Mining and Scientific Press with its last issue, commenced its twelfth volume. Since Dewey & Co. have "beld the ribbons" its gilt has been rapid toward a perfect journal. Its appearance evidences its prosperity, but doubtless, like some of the rest of us, it can stand increased encouragement. Let such be given, and our word for it, volume thirteen will acknowledge receipt. —[Golden Era.]

MINING AND SCIENTIFIC PRESS.—We received a visit a few days since, from Mr. Wood, agent for the Mining and Scientific Press, who is now canvassing this county for subscribers to that valuable journal. The Press is invaluable to miners and mechanics, being the only journal of any importance on the coast entirely devoted to their interests. —[Mountain Messenger.]

SUBSCRIBE FOR IT.—The large, illustrated sixty-four column weekly newspaper—the San Francisco Mining and Scientific Press—should be taken by every miner, prospector and intelligent citizen throughout Colorado, as it gives a most of most useful information to be gained no other way, on mining matters generally. —[Rocky Mountain News.]

The publishers intend to make it the "Scientific American" of the Pacific Coast. Every miner should have a copy of it in his cabin, for it will be filled with useful information to the pick and shovel fraternity. —[Trinity Journal.]

It contains correspondence from different sections, giving accounts of new discoveries in gold, silver and copper, and should be taken by every person that wishes to keep well posted on the developments of our State and the Territories. —[Mountain Messenger.]

The Mining Press is particularly the miners' journal, and is doing more for the solid interests of the State than any other, by enabling its readers to unlock the mines of untold wealth which lie waste around them. —[Mountain Messenger.]

The public should support the enterprise of the Mining Press, one of the best papers in the State, by a liberal patronage, as it is only by a system of legitimate reports that our mines can be favorably brought before men in capital below. —[Calaveras Chronicle.]

It embraces one of the finest fields in the world, and seems to improve it. * * * It will be second to no scientific record now published on this continent. —[Los Angeles News.]

Prof. J. D. Whitney's address on Mining, is given entire. * * * We preserve the Press, and would like to have a full file. —[Napa Reporter.]

Friends pleased with our efforts in the publication of the Press can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

SUBSCRIPTION IN ADVANCE.

One Year, (two volumes)..... \$5.00
Six Months,

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County—

From the Silver Mountain *Bulletin* of Oct. 13th: The balance of the machinery for the Washington mill, arrived on Friday of last week, and ten days from date will probably see it in motion. The embarrassments attendant upon starting new machinery may possibly defer active operations until the last week in this month. . . . Buckeye No. 1 still lies in *statu quo*; the Northwestern Company, of Wisconsin, who leased the mine, not having made any movements as yet toward commencing operations thereon. . . . Orss are being hauled from the Morning Star to the Washington mill, preparatory to working them. . . . The I. X. L. mine is to be timbered up, and work commenced at once. . . . Times are looking up; by the middle of November sure, we shall be regularly shipping "bricks" from the Morning Star and George Washington. . . . A condensed statement from the report of the superintendent of the Pennsylvania Company, shows the financial affairs of the company to be in a healthy state.

The *Miner* of same date says: Several new mining claims have recently been located in this district, and considerable attention is being devoted to prospecting at this time.

The steam mill which has been referred to in several instances as the "Davidson Mill," is the "Geo. Washington Mill." Davidson's is a sawmill close by, running by water power.

Amador County—

From the *Ledger* Oct. 13th: A company is being organized to sink a shaft through the "marl" bed at Butte City. This marl (a sedimentary deposit) is situated in a large basin southwest of, and near, the Jackson Butte. Its surface, and the surface of the surrounding hills, were immensely rich. All attempts to get the bottom have heretofore failed. . . . Tim Hinkley's quartz mine is giving out. Thursday it gave out over one thousand dollars in clean, free gold, at last accounts was still giving out. . . . The Coney & Bigelow is "giving out." A recent run paid twelve dollars, free gold, to the ton—nearly double the usual amount. . . . Evans, Meek & Co., contemplate putting up a quartz mill soon on the South Fork, near their mine. Their shaft is now down about thirty feet. Prospects continue favorable. . . . The Kearsing mill will soon have sixteen of Ambler's pans and amalgamators attached to it. The owners of the mill have entered into a contract with Meader & Co. to work rock from the Coney & Bigelow mine.

At Middle Bar, Chesley, Reddington, Fogus and Marlette have sunk a shaft on the first south extension of the 'old Marlette' mine this summer, and at a depth of sixty feet are getting some good ore, though, as yet, they have not found the main lode. They are now drifting east, through the black gouge, and there is little doubt that they will get a valuable mine. We were shown a piece of quartz the size of a goose egg containing more than a hundred dollars in gold.

Calaveras County—

From the *Courier* of October 13th: Messrs. Gleason & O'Neil have recently struck rock of most extraordinary richness in their claim—the old Foot and Thompson lead—at Rich Gulch. The claim was very successfully worked several years since by the then owners, who erected a mill thereon, and took a very large amount of money out of the lead; but striking a barren spot in the vein, they abandoned it. The present owners have run a tunnel some six or seven hundred feet in length directly on the lead, and the rock for the entire distance prospects handsomely. The streak of extremely rich quartz recently discovered is about two feet in thickness. . . . The Gold Hunter company, of Salt Spring Valley, are still taking out rich rock at the depth of fifty feet. . . . We learn that a new vein, two feet and a half wide, very rich in gold, has been struck within the present week in the Hardy claim, French Gulch.

From the *Chronicle*: We have been shown forty-two dollars obtained from two tons of rock from a quartz lead in West Gulch. A shaft has been sunk to the depth of ninety feet on the claim, and the ledge is one solid mass of gold-bearing quartz, six feet wide, from the top to the bottom. The rock crushed was unassorted. In addition to the above, the sulphurets, which constitute about five per cent. of the rock, assay \$800 to the ton.

Humboldt County—

From the *Journal* of October 4th: The Fanner Farm Oil company met on the 17th instant, and suspended for the present. They are 300 feet down; I should say they have about as good prospects before them as any; but they cannot well descend deeper without machinery, which they probably will not get this season.

Kern County—

From the *Havilah Courier* of October 13th: An assay of rock taken from the Governor Troupe lode, on Kern river, owned by Lovely Roger, Hamp. Williams, Wyatt and Martin, was made a few days since by Mr. D'Heureuse, assayer of our town, and the result was fifty-nine dollars and twenty-eight cents of silver, and fifty dollars and forty cents of gold, a larger percentage of silver than ever before obtained in this section. . . . The Alpine Gold and Silver Mining company at Greenhorn have completed their 20-stamp mill, and will let on the steam next week. This company have eighty hands employed, and about five hundred tons of rock ready for crushing.

Los Angeles County—

From the *News* of October 2d: Messrs. Searls and Yates have discovered a gold-bearing quartz lode, in San Francisco canyon, about forty-five miles from this city, that surpasses in richness anything that has been discovered in this section of the State.

Nevada County—

From the *Gazette*, Oct. 11th: We heard a report yesterday that rich placer diggings have lately been discovered on one of the head branches of the Yuba river, the exact locality of which we are not advised. The diggings had been worked many years ago, the ruins of an old cabin having been found in the vicinity. Some of the dirt of the cabin floor was washed, and yielded from seventy-five cents to a dollar a pan.

Same of the 12th: The Ancient River Blue Gravel Company, whose claims are situated in the neighborhood of Bear Valley, will commence, on Monday next, the erection of machinery for the purpose of sinking a shaft or incline to prospect their ground. An assessment has been levied by the Trustees of the Company sufficient to raise a working capital of \$40,000, which will be expended in developing their claims. . . . The last run of Stiles's mill, on rock from the Banner mine, yielded over sixty dollars a ton. This, we believe, is the largest yield yet made in any full run on the Banner ore. The run was mostly made on rock taken from the bottom of the incline, and is regarded as further proof that the ore is increasing in richness with the depth reached in the mine.

Same of 13th: A number of mining companies are now engaged in opening hill claims situated about ten miles above Nevada, near the Cascades or Falls of Deer creek. We learn that the prospects of the district are highly favorable. The claims of the Sky High company were located last Spring, and the owners commenced sinking a shaft. At twenty feet they struck gravel which gave a fair prospect. They continued to sink four feet deeper, the gravel improving in richness and the gold getting coarser, when they were compelled to desist on account of water. They are now engaged in running a tunnel to drain the claims. Immediately below the Sky High claims are the claims of the Red Diamond Company. The owners commenced the work of opening them by running a tunnel, and are already getting good prospects.

Same of 16th: The Glenbrook quartz mill, in Eureka township, was started up for regular work on Wednesday last. We learn from R. C. Black, one of the owners, that they had crushed seventy tons in three days. At that time they had not cleaned up, but from the amount of amalgam saved on the coppers, they anticipated a good yield of the rock.

It is estimated that the amount of rock crushed during the coming winter will be double that of last. The hydraulic and placer miners, too, are very generally making arrangements to commence running as soon as a supply of water can be had.

From the *National*: The Eureka mine is now being worked on the lower or third level, which is 320 feet from the surface. Drifts have been run to the distance of 270 feet one way, and 300 the other, from the bottom of the shaft. An incline 75 feet deep has been sunk on this level, out of which rock is now being taken. The pump is worked by a 26-horse power engine, and the hoisting is done by an engine of 12-horse power. The company propose to sink another shaft of about 300 feet in depth at a distance of 170 feet west from the present shaft. They have a twenty-stamp mill, which crushes forty tons of rock a day, three of Atwood's Amalgamators, and two arrastras, for which Knox pans are shortly to be substituted. The motive power is a 60-horse power engine. Two new boilers of 44-inch shell have lately been put in, which consume five cords of wood daily. Amalgamation is effected by means of blankets and copper plates. One of Hunter's Concentrators is now on trial. In the last year there has been taken out of this mine and crushed 11,460 tons of rock, with an average yield of \$50 to the ton. This gives \$573,000 as the total yield of the mine for the past year. The company have now on hand about \$15,000 worth of sulphurets, the best of which assay over \$400 a ton. One hundred and twenty-five men are employed in the mine and mill.

On Saturday last, some of the owners of the Spring Hill mine, representing the controlling portion of the stock, came up from San Francisco and ordered Captain Day, the Superintendent, to stop operations and take out the machinery; but the Captain believed himself to be near the ledge, and asked permission to work another shift. Nothing was, however, effected; but as the men were leaving the mine, the Captain put in one more blast on his own hook. . . . When the smoke cleared away he found he had struck the long-looked-for ledge, and his judgment was vindicated. Work was immediately resumed. The ledge has since proved to be well defined, rich in sulphurets, and varying from twelve to twenty-four inches in width. The incline is at present 240 feet deep, most of which was blasted out. The opening of the mine has been attended with an expense of about \$48,000, on account of the exceeding hardness of the rock.

The pump of the Essex mine, which has been shut down for the past two weeks, was started up again this morning (15th). The company now intend to run a prospecting shaft or incline from the old tunnel, and to continue working the mine until further developments show, beyond the possibility of a doubt, that the mine will not pay.

From the *Union* of the 13th: The remainder of rock to complete five tons arrived from the Mary Etta claim, on Diamond Creek, yesterday morning. Some twenty mules packed the rock to Grass Valley. We are not advised when the mill will commence the crushing of this rock, but suppose it will be during next week.

EXCELSIOR.—From the *Sun* of Oct. 11th: We are informed that the result of the late crushing of four tons of ore from the Gold Run claim, at the California mill, will go over \$30 per ton. . . . The yield of a thirty-four hour run of the Winton mill, on Mohawk rock, was \$414. This is very good for a five-stamp mill. . . . We yesterday saw about six ounces of bullion from the Wisconsin Company, obtained from rock worked in an arrastra, valued at \$100. . . . Chappetele, the obliging superintendent of the Mohawk and Montreal, yesterday showed us a fine little bar of bullion, weighing \$75.71, obtained from four tons of rock from the Eclipse Company's mine. . . . In our monthly statement of the amount of bullion shipped from this district during the month of September, we overlooked shipments to the amount of \$245.81 from the Mohawk and Montreal Company's mine. . . . It is rumored about town that the Pacific Company have leased the Winton mill for six months, from the first of December, and that they intend to erect two more sets of batteries, of five stamps each, and make other substantial improvements. . . . The Excelsior mill is now steadily at work, crushing some forty tons of rock per day.

Plumas County—

From the *National* of October 13th: The Crescent company are moving their 24-stamp mill over to the Premium and Plumas lodes. The mill will be in running order in a few weeks. . . . We learn that the old Hessler mill, in Argentine district, owned by the Sherman brothers and Caniday, with only three stamps, is paying from forty to sixty dollars per day. . . . Messrs. Judkins and Kellogg have let the contract for putting in the famous Round Valley dam again, to Mr. Young, of Indian Valley. He has a large force of hands employed to work upon it. . . . We learn that the Bull Frog mill, on Bush Creek, has been stopped, and the hands discharged, the mill having ceased to pay.

Shasta County—

From the *Courier* of October 13th: The Mammoth company are carrying on work vigorously—running the mill, getting out rock, and sinking shafts. . . . The Potosi made another short run last week, and cleaned up \$665.37. . . . All work has been suspended on the Kellinger claim for the present. Twenty tons of ore from the upper tunnel was smelted in San Francisco last week, and if the yield is equal to expectation, work will be resumed in a short time. . . . The old Pittsburg mines around the base of Bully Hill are yielding well wherever water can be procured. Sanford has struck good diggings, and the Bamboo company are still taking out good pay.

The prospects of the South Fork mines continue favorable. Work in the Chicago is going on briskly, and the lode is looking and prospecting splendidly. The Big Central lode shows a width of six feet, and the rock prospects satisfactorily, getting better as the shaft descends. The Red Warrior claim is looking up in importance, and one of the stockholders boasts of having refused five dollars per foot for 150 feet. . . . The stockholders of the Crystal ledge have effected a conditional sale of their mine to a San Francisco company. The company agree to prospect the lode until the first of January, and at the expiration of that time will either relinquish it to the original owners, and pay them the sum of \$12,000, and retain it permanently.

At Lower Springs Mr. George has prospected on three different lodes during the past month, and finds that either of them will pay from ten to twenty dollars to the ton, without sorting the rock.

Sierra County—

From the *Messenger* of October 13th: At Bear Valley, on Thursday last, very rich rock was struck in the General Grant. They sunk on the shaft to the depth of seventy-five feet, and then drifted to the ledge. . . . At Indian Hill a large number of new claims are being prepared for working at the commencement of the approaching water season. . . . At La Porte John Conly has started a bed-rock tunnel to work the old engine ground of Cook's, located near the old Pontusac of early times in La Porte, and which was known to be rich.

A conditional sale of Ironsides mill and mine has been effected to Messrs. Barton & Taylor, of Virginia City, for \$10,000. This claim is situated at the head of Jim Crow Cañon, and has on it an excellent 8-stamp mill. The parties have ninety days in which to prospect, and if it proves a paying mine they will take it.

Siskiyou County—

From the *Yreka Union* Oct. 13th: On Scott river, some of the claims are paying remarkably well. We hear of one instance of last week's work, six men, paying \$585. . . . Faith in the wealth of the quartz of Humboldt and vicinity is growing stronger every day. Rich specimens are exhibited by many owners of leads.

Trinity County—

From the *Journal*, Oct. 13th: Since ex-Sheriff John B. May and Captain Bob Curry struck their rich claim in Cañon creek, above Junction City, the miners in that section are waking up. Many claims have been located between Junction City and the old Butler place, and new domicils are already going up. May & Curry's claim is yielding from \$100 to \$200 a day—occasionally a \$50, \$60 or \$70 piece.

Tulare County—

From the *Visalia Delta* of Oct. 10th: Lieut. Hepburn has brought us a specimen of quartz from a lode recently discovered in Kearsarge district, by our old neighbors, the Brothers. It is copper and silver, and of amazing richness.

Tuolumne County—

From the *Columbia Citizen*, Oct. 13th: Three pans of dirt from the Levy claim, that we saw washed one day this week, yielded five dollars. Mr. Levy brought a handful of dirt into our office, taken from a crevice, literally filled with the precious metal. . . . From two to three dollars to the pan is the average amount obtained in a cut recently run through Mr. Shilling's garden. An offer of \$8,000 was refused, a few days ago, for this lot. . . . The Haskell quartz lead at Whitman's Pass, about four miles from Columbia, is beginning to attract attention. Twenty tons of rock were taken to the Harding mill last week and crushed, which yielded one hundred and twelve dollars per ton. . . . Messrs. Jones & Woodman, at American camp, twelve miles from Columbia, have their shaft down about fifty feet, where the vein is from fifteen inches to three feet in thickness, and immensely rich. Samples that have been assayed yielded at the rate of from \$1,000 to \$20,000 per ton. We saw one piece weighing less than half a pound, that contained ten dollars in gold. The proprietors will have a 10-stamp mill running in a few days.

From the *Sonora Democrat* of 8th Oct.: Mr. Byrne, one of the owners of the Daly claim located on Main gulch, showed us a chipa weighing 2½ ounces that his company found on Wednesday. The Daly claim is paying well at present. Out of two "washings" the company, of six men, realized thirty-one ounces of gold dust. . . . Messrs. C. & D. Kelly have struck a rich lead on Fox gulch, near Pine Log. They are getting out ten or twelve tons of rock to be crushed at the Rawhide mill.

Yuba County—

Timbuctoo letter to the Marysville *Appeal* of October 15th says: The Western Star is one of the most promising copper mines in this district. The vein averages 2½ feet. Shaft 185 feet in depth. A large amount of eighteen per cent. ore is already out. Another promising copper mine is the Red Rock, situated some five miles from this place. The Red Rock is represented to be a very large lead of eight or ten per cent. ore. The average width is in the neighborhood of twelve feet. Since my arrival here I have been shown several specimens of silver-bearing quartz from a lead near this place. I am told that the average rock from this lead will assay over three hundred dollars. Of the hydraulic or gravel claims, the Bab is one of the most promising. The owners think of erecting a 10-stamp mill in which to work their cement.

NEVADA.

Washoe—

From the *Gold Hill News* of Oct. 11th: "The report that the Confidence mine had temporarily suspended operations by order of the Board of Trustees, in San Francisco, is en-

tirely without foundation. A small portion of the hoisting gear over the mine broke, but it is already repaired, and this caused a brief suspension of the hoisting of ore. The dumps, however, were full, and none of the mills, supplied from this mine, were delayed in the least."

Reese River.

From the *Reveille* of Oct. 6th: Many wise ones shake their heads at our account of the enormous size of the ledges in the Reveille district. They accept without a doubt all that was said of its extraordinary mineral, as fabulously rich as it appears to be, because they have seen it and placed their hands upon it, and it speaks for itself. Mr. F. M. Clarke, a gentleman and a disinterested witness, writes thus: Of the quality of the rock you will be your own judge, but as for the size of the ledges the least that can be said of them is they are monsters, at least from ten to fifty feet thick, and any amount of the same kind of rock as he will show you can be had on the surface, as I can testify. Mr. Monroe, one of the discoverers, accepts this testimony, but will go the gentleman twenty to fifty feet better.

Same paper of 10th, says: Owing to the discovery of heavy deposits of mineral, lying chiefly southeast of Austin, during the last four months, the public attention has been nearly diverted from the mines in its immediate neighborhood. The manner, too, in which several large and expensive properties in this district had been managed, almost led to the belief that the ledges of the district were too small and uncertain to prove remunerative. As good mining property as the sun ever shone on, has been slaughtered by the ignorance of pompous agents and superintendents, until the general faith in the character and permanence of our mines has well nigh been lost. In the North Star mine, for instance, the working had been carried on without the least regard to systematic mining, and was little better than a series of subterranean zigzags or gobber excavations. The search for the lost vein was finally abandoned, under the belief that it had terminated. Under the present management, the work has been resumed by Superintendent Frost, one of the original discoverers of the mine, whose thorough knowledge of the course of the vein led him at once to the point where its rich deposit had been passed or lost. The vein is now exposed for a length of 320 feet, disclosing mineral equal to the finest yet discovered in the district. An idea of the size of the vein will be conveyed when we state, that there are specimens in the office of the company, which have been extracted from the recovered ledge, weighing 500 pounds and upwards, and measuring three by four feet—masses of richest sulphur ore, assays of which range from \$600 to \$6,000 per ton.

Same of the 11th: The case of the Oregon is similar to that of the North Star. In 1863 a 10-stamp mill was erected by the company. After a while it was discovered that the ore could not be successfully treated without roasting, and the first reverberatory furnaces were built at great expense. In 1865 the property passed into the possession of the Manhattan Company, which had the advantage of ample capital. In the course of time the original mill was dismantled, and a costly 20-stamp mill was erected, furnished with every accessory befitting the operations of a wealthy company. Then followed an expenditure of thousands of dollars in confused and intricate borrowings by the scientific gophers who were placed in charge. The course of the vein is nearly east and west. It had slipped through the fingers of the workers. A scientific man from a neighboring mill was called in to survey the ground. He did the work as requested, and gave them as their true line of working to recover the vein, a course directly southeast. They worked on this line all summer, penetrating a distance of 130 feet. The interposition of the sheriff stopped the wild excavation. When Superintendent Frost came into position under the present management, he obtained the reluctant consent of the General Agent of the company to alter the line of working. He drove a cut eighteen feet due north, when he exposed the original and beautiful vein of the Oregon, just twenty-five feet from the line of the main incline. The splendid vein, which had been lost sight of by the gophers, is three feet thick, and from the level to the surface there are 135 feet wholly untouched, which may be stooped out at will.

A letter in the *Nye County News* of Oct. 6th, has a description of the splendid reduction works just erected near the Murphy mine by the Twin River Mining Company, of which we give an abstract. The buildings are of stone. The furnace is of the McGinnis pattern. The amalgamating room is furnished with six pans of Wheeler & Randall's latest improved style. The settlers are seven feet in diameter, and there is one to each tier of pans. The battery of twenty stamps, is of the "knee style," and is regarded as the model battery of the State. The motive power is a splendid engine of 125-horse power.

Humboldt.

From the *Register* of October 5th: The

Manitowoc boys are getting along hugely. Four hands at the mine are taking out on an average about two tons of first-class ore per day. On the North Star ledge the superintendent is pushing work ahead vigorously. At present he is sinking a prospecting shaft on the ledge, which has every appearance of a true fissure vein. The ore is similar to that of the Manitowoc—a sample of average rock worked by mill process being 983 fine, and yielding \$119 to the ton. Work in the Rochester claim, on the Montana ledge, goes bravely on. At a depth of 135 feet in the main shaft a drift was started, which is now in 120 feet—daily expecting to strike the ledge.

The same paper has the following star items: American Basin tunnel still driving in. Working now in a streak abounding in iron. Additional force put on last week. Yankee contract being pushed rapidly to completion. Some seventy-five feet more to finish, which will put the tunnel in 500 feet. Reported that the Whitmore will resume work soon. Change in the management of the Sheba mill. Mr. Beale is now running it with the renowned Sauchez as amalgamator.

ARIZONA.

From the *Miner* of Sept. 26th: The second Lamson mill (Thunderbolt) is being erected on the Ticuandroga lode. Ex-Judge Flower, of Yuba county, is to have charge of the Johnson and Groom mill, on the Sterling lode. Gold bars from the Borger mill are now quite common in town, and convey a substantial and gratifying evidence of the richness of the Big Bug mines. The scarcity of labor is keenly felt by our miners, ranchmen and freighters. Permanent employment at high wages can be given to a large number of men, and we hope they will be forthcoming. We hear that Mr. Borger has had to send to California for hands to work at his mill and mines.

From the *La Paz Gazette*: Everything is being got in readiness for an early commencement on the Vulture mine at Wickenburg. The machinery which is soon to be erected on the Sterling mine at Prescott, comprises two Beath mills, and a four 700-pound stamp battery. The machinery to be erected for the New York Moss Association, at Hardyville, of which Charles Strong is superintendent, comprises one 40-horse power engine, 12x24 inch cylinder; two 5-stamp batteries, with mortar independent of the framework; three of the Wheeler & Randall tractory pans; two Knox pans, two 7-foot separators; one large portable 10-ton derrick, framework for tanks, mill, etc. complete.

From Williams Fork we have the following: Work is being prosecuted by the Springfield Company on one of their claims, with good indications of success. Mr. Thompson is progressing finely in his smelting operations on the Great Central. Knowles & Lightner will have their two smelting furnaces in operation in about a month.

The Reese River *Reveille* says: The emigrants to Arizona from Austin appear to have had a very hard time. The party went from here southeast to Pahranaagat and the Colorado, and of course passed the ground where have since been discovered the Northumberland, Silver Bend, Danville, Hot Creek, Empire, Reveille and other districts richer by far than their wildest hopes ever pictured for them in Arizona.

IDAHO.

From the *Avanache* of Oct. 6th: The N. Y. & O. Co. have purchased the Eureka and Noonday quartz ledges this week; the former at \$3 per foot and the latter at \$7.50. The Knickerbocker Company are continuing their prospects on the Trook & Jennings and the south extension of the Morning Star claims. The latter has recently given signs of improvement. The north tunnel which starts seventy feet down the shaft, and runs under Loog Gulch, discloses more and richer ore than heretofore. The work is carried on night and day. The Trook & Jennings shows no additional encouragement. J. H. Johnson, of Flint district, has sold the "Tom Sturgis" quartz vein to J. P. Hopkins of New York.

From the *Idaho Times* of Sept. 28th: Mr. Kirkpatrick, an old mountaineer, has lately returned from a prospecting tour to the headwaters of the Payette and Salmon rivers. He reports having found prospects of from one to two cents to the pan, and would have investigated further had the snow not driven him out of the mountains. Some miners have organized another tunnel company on East Hill, to be commenced above Butler & Co.'s mill, on Moore's creek. Messrs. Channel & Co. are extending the old original Elk and Deer creek ditch along the summit of the divide between Grimes' and Elk creeks, to a point about three miles below Centreville.

Same of 2d Oct.: The East Hill tunnel is into the hill for over 231 feet. One and a half pounds of the hard substance they are now picking through—a kind of granite clay—was found, after a careful assay, to contain forty-two cents in gold. Clute & Co. on Moore's creek, cleaned up over \$8,000 for the week

ending last Sunday. Mr. Sanders intends keeping the Elkhorn machinery in motion all winter. The mine is looking more flattering now than at any time heretofore. Redmond & Co.'s claim, above Pine Grove, are running two sluices and employing sixty-five men. Clifton & Bottany, who are mining the ground on which Pine Grove is located, are employing about thirty-five men. The French Company are employing from forty to sixty men. Mc-Northcut & Co. are also employing a large lot of men.

MONTANA.

Bannack correspondent of the *Post* of 29th Sept. says: A train of thirty-one wagons, containing a 20 stamp mill, three sets of furnaces, and other machinery, for the Montana Mineral Land Mining Company, and also cupelling furnaces for the Rocky Mountain Gold and Silver Mining Company—passed through town to Marysville. Charles D. Everett is superintendent of the latter company, and is pushing operations ahead on the Wide West, and preparing to erect his furnaces at once. The Wide West is a silver lead in the Blue Wing district, of a very peculiar and rich ore, which is easily reduced by the smelting process.

Messrs. Kirby and Clark have nearly everything ready to put up their machinery; and tons upon tons of rich quartz, which has been taken from the Mademoiselle is ready for their 20-stamp mill.

Helena letter: "It is estimated that over five hundred persons will start from Fort Benton about the first part of next week, and the amount of treasure going down will fall little short of one and a half million dollars."

COLORADO.

From the *Journal* of Sept. 25th: The Boh-tail mine of the Sterling Company has a 30-inch pay vein the entire length of it and about 100 cords of ore. The pumps will be put in this week. The Kip & Buell Company are doing very well on the Leavitt lode, getting about \$120 a cord with their old stamp mill from the ore right along. In Russell Gulch, there is no revival as yet. The mills put up there last year, some of them yet unfinished, are standing still with a very few exceptions, and some of the most noble gold veins in the country, large, rich, and easily worked, have been so long deserted that the prospect holes and gouging are filled with grass and bushes to the bottom. Dr. Carpenter, at the McIntyre mill, has fixed the reverberatory desulphurizer in that mill so as to test his process. He took 800 pounds of tailings from the Mercer County, lying outside of the mill, which assayed \$9.03 a ton, desulphurized it and sent it to Clear Creek to Ellicott & Snider's assay. He also sent the same amount of the same tailings, undesulphurized. From the latter the assay got ten grains of gold, from the former seventy-four grains.

From the *Denver News* of Oct. 3d: Our latest advices from the Snake River mines are that Whitney & Whiting will run a tunnel on Ten-Mile creek this winter. The agent of this company is developing their property in Peru and Snake River mining districts. J. Blackman, of Mill City, is packing over the range one thousand pounds of ore from the Esmeralda lode, Snake River, to be sent to Philadelphia for test. Joe T. Boyd, prospector for the Nonpareil Company, is now sinking a shaft on a lode with a 25-foot crevice, in Colfax Park, Snake River district. The ore is a very fine appearing argentiferous galena mixed with chloride of silver, and those who have seen it feel confident of its great value. It is called the J. E. Wharton lode.

AGRICULTURAL COLLEGE.—The Board of Directors of the California State Agricultural College held a meeting in this city on Monday last, when they decided to immediately commence the examination of the various sites proposed. They visited San Jose on Tuesday, Oakland on Thursday, Napa on Friday, and will be at Sacramento on the 22d. These are the only counties thus far which have made proposals for the location of the College. Counties or communities having locations to offer, should make their propositions to the Board immediately, and they will be promptly acted upon. The Board consists of Gov. Low, Chairman; Charles F. Reed, President of the State Agricultural Society, Sacramento; H. J. Booth, President of the Mechanics' Institute, San Francisco; Felix Tracy of Shasta; William Holden of Mendocino; C. T. Ryland of San Jose; Henry Phillips of Nevada, and J. R. Meader of Copperopolis.

A LIQUOMETRE.—At one of the late sittings of the French Association for the Advancement of Science, a new instrument, called a liquometre was exhibited. It is intended for estimating the amount of alcohol in wines, and is based on the principle of capillary action. It consists essentially of a very fine graduated tube. The instrument is said also to give separate indications of the amount of tartar and extractive matter.

REMARKABLE PHENOMENON.—A private letter written by a St. Louisian, sojourning in New England, gives the subjoined description of a wonderful phenomenon witnessed by himself and others from the summit of Mt. Washington on the afternoon of the 28th of August:

"We were standing about an hour before sunset on the southeastern portion of the cone with our faces turned to the east, looking down upon the Glen House miles below. Immediately in front of us rose the lofty Carter ranges, which were occasionally hidden from our view by heavy masses of mist, which, rolling up the mountain side, enveloped us at times, and then caught by a changing wind, would float afar off down the valley. It was while one of these floating clouds was sweeping between us and the Carter mountains, that we perceived at first the faint tracery of a rainbow, which gradually developing itself, expanded into full perfection, with this exception only, that instead of being arched it formed a perfect circle, apparently about fifty yards in diameter. Suddenly, to our inexpressible amazement, we beheld our own figures photographed as it were on the misty back ground which formed the center of the rainbow. So distinct and perfect were the representations that each one of the party readily recognized their individual figures. Arms, hats and shawls were freely waved by the party; fingers, expanded, and instantly each motion was responded to by figures in the clouds. This phantom-like picture lasted about a minute, and then was gone."

The figures of the party were, as will be noticed, directly in the line between the "misty back ground" and the setting sun, whose rays were thus intercepted. The mountains beyond served as the coating of the mirror. The same appearances have, we believe, been witnessed in the Catskill mountains. The famed "Spectre of the Brocken, the highest summit in the Hartz mountains, was a source of superstitious fear with the German peasantry, to whom it furnished the subject of a legend. A gigantic human figure, believed to be a diabolical portend, was at times visible. Science has explained it as the image of the observer's own figure, produced by refraction and reflection; and occurring whenever certain atmospheric conditions and a certain elevation of the sun coincide.

INSECT WAX.—We clip the following paragraph from the *Farmer* (Scottish): "The trade in this article in China is large. In 1864, from the single port of Hankow alone 5,100 cwts. were exported. It is taken by the Chinese as medicine, but is principally used as stearine in the manufacture of candles. It is one of the most valuable of the many products of Sze-Chuen, being worth sixty and seventy taels per picul (133 lbs.). The wax is deposited, for the protection of its eggs, by an insect which inhabits the trees on which the wax is secreted. The formation of the wax was a subject which occupied the especial attention of M. Simon, a French savant, who, a year or two ago, passed a considerable time in the interior, during which he is said to have traversed the greater portion of Sze-Chuen, and to have reached the eastern confines of Tibet. It is to be hoped the result of his researches into the products of the former fertile province will ere long be made public."

REVOLVING FIREARMS.—The New York *Artisan*, in copying the story of the ancient revolving pistol, which Col. Colt once saw with feelings of great surprise in the historical collection at Dresden, (which account has also appeared in this paper), adds the following: "In the World's Fair at the New York Crystal Palace, in the year 1853, there was exhibited a collection of ancient weapons from the Tower of London; and among them was a revolver like that above described and of about the same age. Col. Colt's patent was out for the revolving cylinder, but for making it self-revolving by the act of cocking the hammer."

WATER, in passing from the solid to the liquid state, converts 140 degrees of sensible into latent heat; in passing from the liquid to the aeriform condition, it absorbs 1,000 degrees of heat, rendering it latent. Alcohol, in evaporating, absorbs 374 degrees of heat; ether, 163 degrees; and spirit of turpentine, 138 degrees.

VALUE OF KNOWLEDGE.—Knowledge is the true alchemy that turns everything it touches into gold. It gives us dominion over nature, unlocks the storehouse of creation, and opens to us the treasures of the universe.

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. Thomas Starr is Agent for the MINING and SCIENTIFIC PRESS in Nevada, and will canvass the principal cities, towns and districts of that State. August 25, 1866.

Mr. O. P. Truedell will act as our Corresponding Agent and Solicitor in the interior of this State, from this date August 25, 1866.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.
SAN FRANCISCO, Jan 11th, 1866.

San Francisco:

Saturday Morning, Oct. 20, 1866.

NOTICES TO CORRESPONDENTS.

OWING to the large amount of correspondence received relating to interesting points connected with Mining, Metallurgy, Mechanics, etc. we are compelled, for want of time and space, to reply briefly in the following form to a portion of such queries as are of general interest.

T. Y. WASHOE.—The change which you have frequently observed in quartz rock, at the waste heaps of several mines at Washoe, and some of the adjoining mining districts, arises from the presence of phosphate of iron, which is known to mineralogists under the name of "vivianite." It is found even more abundantly than in your neighborhood, as an accompaniment of many of the gold mines of Central America—the Purima is particularly noted for it. Vivianite, or blue iron ore, is supposed to obtain its peculiar color in consequence of the conversion of a portion of the oxyd of iron into peroxyd by exposure to the atmosphere, as the phosphate of the peroxyd of iron is white. Gmelin relates that a pit in a town had been filled for centuries with heaps of bones, wood, gneiss, etc. On the carbonized pieces of wood, and likewise on the micaceous laminae of the gneiss (which contained iron), but not on the other constituent of it, were seen white crystals of ferrous phosphate, which turned blue on exposure to the air. According to Schlossberger, some iron nails in the stomach of an ostrich, and partly enveloped in black animal matter, became covered, after several days exposure to the air, with blue spots, which appeared to arise from the formation of triphosphate of ferrous oxyd. Hardinger mentions the occurrence of crystallized vivianite in the hollow of a bone in the skeleton of a miner found in an old working at Turnowitz. We would like to be informed whether this substance is found more abundantly near the surface, or in the deeper workings, as the prevalence in one part as compared with the other, would probably lead to satisfactory evidence as to where and how the phosphoric acid has been derived. Had competent men been employed in the superior and better paid positions at the principal Washoe mines, this and many other interesting subjects would long ago have been fully elucidated; and economic advantages would probably be derived therefrom, to say nothing of its great scientific interest.

AN ARTISTIC STUDENT.—The difference is very great between Roman and Tuscan mosaic. By the way, we may remark that the latter is more generally known under the name of "Florentine," from the city of Florence, where this art is most practiced and better understood. Roman or ordinary mosaic work may consist of pictorial illustrations, composed of square pieces of colored paste or baked earth, which, when arranged, possess more or less the general aspect presented by similar delineations formed by ladies in what is called "Berlin wool." The coarser kinds, such as tessellated pavements for baths, were much patronized by the ancient Romans. Portraits and architectural representations are, however, made, in which the material employed are of microscopic minuteness. Such sometimes employ several artists for years, the cost of which occasionally reaches \$10,000 for a picture not covering more than five square feet. The Florentine mosaic is of quite a different character, and has two varieties, the more common being formed of artificially prepared enamels; the finer kind, known as *pietra dura*, is composed wholly of natural stones and gems. Flowers and bouquets are the objects usually imitated in this kind of mosaic, some of which, in *pietra dura*, are admirable specimens of artistic skill and taste. Ornamental tables and cabinets are the subjects usually made use of to exhibit the highest specimens of skill in this art, the value of which may be conceived when we mention that a table thirty inches in diameter, so ornamented, not unfrequently obtains \$4,000. The rich brilliancy of color exhibited by flower and foliage, can in no manner be so well represented as by highly polished natural stones. In nothing is patient, artistic skill so well exemplified as the occasional introduction of a partially faded leaf or flower, represented by the insertion of a polished stone undergoing decomposition at the edge.

MINING STATISTICS—THE PACIFIC COMMISSION.

The advantage of the wise provisions established by the English Government for the collection, preservation, and promulgation of general statistical information, is no where more apparent than in the reports annually prepared by Mr. Robert Hunt, giving in detail a practical exhibit of the progress and condition of the mineral resources of that country. One of the most important and practical deductions to be drawn therefrom is the annually increasing evidence derived from the statistics furnished, that the might, wealth, and influence of the British commonwealth is traceable directly to this branch of her national industry. It may, perhaps, be claimed that her prosperity is more especially referable to the magnitude of her manufacturing operations; but without her mineral deposits—her coal, her iron, her tin and her copper—what would become of her manufacturing importance? Iron supplies her metal for machinery, and her means of national defence, and coal furnishes her fuel for steam power; on these two elements, almost exclusively, rests her greatness in manufactures, and the magnitude of her power in the world of labor.

These annual exhibits of her mineral productions are mile-stones marking her progress, and afford the best possible data from which to regulate her governmental policy with regard to the mines. The long series of years during which these records have been kept, have fully proved their utility, and should stimulate our own Government to take adequate measures for securing the same class of information as a basis on which to regulate its mining legislation. The want of full and reliable statistics on mining has long been felt by reflecting minds throughout the United States; and it is a matter of no little astonishment that no extended systematic effort has yet been made to secure this class of information. All that is attainable, up to the present time, is inadequate, intermittent, and unreliable.

With regard to mining on this coast, while it was confined chiefly to placers and rivers, and carried on by a great number of persons laboring independently, reliable information was almost unattainable, even by Government agency; but now, when placer mining has become systematized, and when quartz mining is the leading branch of that industry, requiring capital, business habits, and detailed accounts of expense and income, it is comparatively easy to collect the information needed. Congress, too, seems to have finally awakened to a slight appreciation of the importance of the matter, and, at the earnest solicitation of the Secretary of the Treasury, has appointed J. Ross Browne, the world renowned tourist, to gather a few preliminary facts, which, let us hope, are to be made the grounds of a more extended and enlightened effort in this direction. The present Commission, however, is confined to the Pacific coast, and placed in the hands of a single individual, with limited means at his disposal; when the movement should, in reality, assume the importance of a regular Bureau, with its head at Washington, and its agents scattered over a field as wide as the national domain.

We have already given the general plan of operations contemplated, as set forth in the Letter of Instructions to the Commissioner, and which we published in our issue of September 8th. We understand that the Commissioner has entered actively upon the field of his labors, and has already obtained a large amount of valuable information, which will be gradually increased and reduced to a proper form for presentation, in the shape of a report, at an early day of the approaching session of Congress. Secretary McCulloch has taken a deep interest in the matter, and seems solicitous that the fullest and most reliable information attainable should be collected; believing that it will be highly conducive to the public interest, and of peculiar and personal value to the miners themselves. We hail this action as an important step in the right direction.

MINERAL PRODUCTION OF GREAT BRITAIN FOR 1865.

The report on the mineral statistics of Great Britain for 1865, arranged under the direction of Mr. Robert Hunt of the British Museum of Practical Geology, has been published, and shows a most remarkable increase in the production of coal during the past year. Sir Roderick Murchison, speaking of this report, says: "It gives a more correct view of the progress of our coal and iron industries than any statement which has hitherto been published." There is a reported increase of 5,362,000 tons of coal over the product of any previous year. We condense from the report as follows:

COAL.—The amount of coal produced reaches the enormous total, in round numbers, of 98,000,000 tons, of which 84,000,000 were consumed at home, equal to 3½ tons per head of population. Of this last amount 28,000,000 was used exclusively for making iron. The amount of coal produced in Great Britain in 1861, was a little short of 78,000,000; showing an increase of 20,000,000 in four years. This increase has been very nearly uniform, proving that it will in all probability be continuous in time to come—a most significant fact when considered in connection with the now quite generally received theory of the rapid exhaustion of the English coal fields. That the stoppage of the export of coal from Great Britain will go but a very little way towards preventing the anticipated calamity, may be inferred from the fact, that out of the ninety-eight millions of tons raised the past year, but a small fraction over nine millions found a foreign market. The home consumption of Great Britain is greater than the total yield of all the world beside. The figures of the coal production of the United States, when compared with those of Great Britain, appear ridiculously small—fourteen and a half millions against ninety-eight millions!

IRON.—The amount of iron ore raised was, in round numbers, 10,000,000 tons, which produced 4,820,000 tons of pig iron, showing an average yield of ore of 48 per cent. The ore raised was used to feed 656 blast furnaces. No less than 6,487 puddling furnaces were employed to provide wrought iron for 730 rolling mills, to put the iron into commercial shape. Of the 4,820,000 tons of pig iron produced, only 543,000 tons were sent out of the country in that condition.

TIN.—The quantity of tin ore produced was larger than that of any previous period, and amounted to 16,686 tons, from which 10,039 tons of metallic tin was obtained, showing an average yield of a fraction over 60 per cent., a larger figure, we presume, than is generally set down for the per centage of the tin ore of England. The quantity of ore raised the past year exceeds that of any previous year; and yet, for reasons elsewhere given in this issue, there is a strong probability that the days of tin mining in Cornwall, which have continued for over 2,000 years, are nearly numbered.

COPPER.—The copper mines of Great Britain have produced 198,298 tons of copper the past year, which has yielded 11,888 tons of metal, showing an average yield of 5.9 per cent.; and this, it should be recollected, is reported ore. This low average is very significant, when taken into account with the very high average of our California copper ore, none of which can be made available here until it reaches nearly double the average yield of the English ore. The production of the British copper ores has been for some time steadily declining, not only in quantity, but also in quality. The price of average Cornish copper ore was \$30.62 per ton in 1856; at the date of the making up of these statistics, it had fallen to \$23.75. The import into Great Britain of foreign and colonial copper ores and regulus, during 1865, was very large, reaching 82,562 tons of ore, and 39,686 tons of regulus; while cake and manufactured copper had also been very large.

LEAD.—The total amount of lead ore raised was 90,452 tons, which yielded 67,181 tons of lead—an average of 74 per cent., showing a

very high grade of ore. The amount of silver realized from this ore was 724,856 ounces, or a fraction over \$8 in silver to the ton of ore.

ZINC.—The ores of this metal—blende, a sulphuret of zinc, and calamine, a silicious oxyd of the same metal—have been raised more freely the past than previous years, owing to a slight advance in the price of the ores. The amount of 17,842 tons of zinc ores were raised in 1865, against 15,041 in 1864. These ores yielded 4,450 tons of metallic zinc, indicating an average of 25 per cent.

GOLD.—The gold yield of Great Britain for 1865 is set down as follows:

	Ounces.
Vigra and Cloran.....	532
Welch Gold Mine.....	577
Castell Carr Dochan.....	587
Castell Carr Dochan.....	8
Gwynnysydd.....	8
Cwmhelian.....	8
Total.....	1,670

The gold yield of 1864 was 2,336 ounces; of 1863, 5,299 ounces. This makes rather an unfavorable exhibit for the future of gold mining operations in Great Britain.

SILVER.—The only silver reported is that derived from the argentiferous galena, above reported at 724,856 ounces.

SULPHUR. to the value of \$355,870, has been obtained from 114,195 tons of iron sulphurets raised and worked.

BARYTES. to the extent of 6,768 tons have been produced. This mineral is largely used to mix with white lead.

ARSENIC.—A return of 826 tons of the white oxyd of arsenic is made, which was reported from other ores at the metallurgical works in Cornwall.

TOTAL VALUES.—The total values of the products of the mines of Great Britain for 1865, are set down, in round numbers, as follows: Metals obtained, \$78,900,000; of which \$58,800,000 was represented by iron; coal, \$122,500,000, receiving its value at only \$1.24 per ton; earthy minerals (not including ordinary clays or building stone), \$7,200,000—making a grand aggregate of \$208,600,000.

DABOLL'S FOG TRUMPET.—C. L. Daboll, of New London, Connecticut, the inventor of the fog trumpet, sends a communication to the *Alta*, in which he says that the power used is Mr. Ericsson's caloric engine, and not steam, as has been supposed. The *Alta* publishes several certificates to the remarkable efficiency of this trumpet, from shipmasters and pilots in the Eastern States and in Europe. Its blast can be heard for fifteen miles. Professor Faraday, as chairman of a Committee appointed by the English Government to test its process, reported it vastly superior to any other signal. The Pacific Mail Company has ordered one to be placed at Point Lobos. It is now on the way to this coast, and we presume our citizens will, ere long, hear it speak for itself.

HERMAN EHRENBURG was killed by Indians a few days ago on the road from San Bernardino to La Paz, Arizona. He was well known in California and Arizona as an adventurous and energetic mining pioneer. He was born in Germany. In 1836 he was one of a party of Texan soldiers who surrendered to the Mexicans as prisoners of war; but who were, in violation of the terms, condemned to be shot. When the fatal volley was fired, Ehrenberg found himself to his surprise uninjured. He started to his feet, and, under cover of the smoke, gained such an advance before he was noticed, that he ultimately escaped. He came to California in 1847. In 1850 he discovered the mouth of the Klamath river. At the time of his death he was engaged in mining in Arizona.

HON. J. W. DWINELLE'S ADDRESS.—We have received, from Louis R. Lull, Secretary, a copy of the address delivered before the Society of California Pioneers, on the occasion of their sixteenth anniversary, September 10th, by Hon. J. W. Dwinelle. It is a most interesting pamphlet. It notes, in elegant and scholarly style, the salient points in the history of California, from the Pope's grant of land to Spain to the time when she became a member of our Union. The same information can nowhere else be obtained in such succinct form. We shall preserve the address with care in our Library.

INTERESTING MILLING EXPERIMENTS.

The utility of roasting or thoroughly calcining auriferous quartz containing any considerable quantity of sulphurets, has been fully exemplified in a recent trial of some rock from the Enterprise mine at Meadow Lake, Nevada county. We are informed that the company had a lot of about 100 tons of rock at the mouth of their mine, the most of which, some fifty tons, was worked at their own mill, and another small lot was sent to Winter's mill near by. The last lot yielded a fraction less than \$9 to the ton; the first yielded about the same amount. Nine and a half tons were subsequently sent to the Pacific Ore Company's Works, at Grass Valley, where the rock, previous to being crushed, is subjected to a roasting process, in bulk, in one of Hagan's desulphurizing furnaces, in which the quartz is submitted to the double and prolonged action of dry heat and steam, while in the furnace. After roasting, it is passed through a stamp mill and pan process. This mode of treatment realized \$28.52 per ton, more than three times as much as was obtained from the same quantity of rock without roasting.

The gold proved to be 961½ fine—an unusual quality of fineness for quartz gold. It is proper to state in this connection, that the process of delivering the pulverized quartz from the battery, adopted in the above crushing, was the same as that which is spoken of below as having been first proposed and practiced by Mr. E. T. Steen, at his mill near Volcano.

The sulphurets found in this mine contain a very large percentage of arsenic. The tailings saved from the fifty tons of rock, crushed as above at the company's mill, were subsequently concentrated down to about three tons, a sample of which was subjected to an assay in this city, which returned 45 per cent. of arsenic.

In connection with the above, we would state that Mr. E. T. Steen, at his mill near Volcano, Amador county, being satisfied that he was losing a large amount of fine gold in the water which passed off from his battery, recently adopted the novel expedient of raising his sieves about an eighth of an inch from the surface of the apron, and then feeding in only so much water as would be required to place the pulverized quartz in a pasty condition as fast as it was reduced. The result was that the pulp, instead of passing through the meshes of the sieves, was gradually forced out through the longitudinal opening beneath the sieves, into a proper receptacle, from which it was shoveled into the pans and treated in the ordinary manner. A very small quantity only, of coarse grains of quartz, as large as could pass through the opening, were found in the pulp, and these were readily reduced in the pans. The advantage gained by this device, must be the saving of the fine gold that is lost by the rush of water usually employed. If the quartz can be successfully discharged from the battery in this manner, its advantage is obvious, and is much preferable to running into tanks in all cases when any free discharge of water is allowed from the tanks. This method of discharge, we are informed, has been successfully tried at the Pacific Ore Company's Works in Grass Valley. The experiment might be easily made at any mill. If successful, and if the discharge can be as readily made, it must give all the advantages of dry crushing, without any of the inconveniences of the dust arising from that process. The pulp can be quite as easily handled as when dry or merely moistened with water.

As one evidence, out of numerous others which have repeatedly been reported to us, relating to the great loss of gold with the rush of water from the ordinary stamping mill, we will give the following as stated to us by one of the parties connected with the Pacific Ore Company's Works, above alluded to. A large quantity of quartz, containing a considerable amount of sulphurets, was finely pulverized, thrown into a tank and thoroughly saturated with water. The black scum, which will at ways float for a long time upon water under such conditions, was carefully skimmed off,

until an amount which, when dry, weighed three pounds, was accumulated. This material was then submitted to a careful hand process of treatment, and yielded at the rate of \$1,200 per ton! This is no isolated case; as we have heard of scores of similar experiments, all going to show the wasteful character of the usual treatment of gold quartz. Settling tanks are no guard against this waste, when any portion of the water is allowed a continual flow from the mill.

[Reported for the Mining and Scientific Press.]

California Academy of Natural Sciences.

REGULAR MEETING, Monday, Oct. 15, 1866. Dr. Kellogg in the Chair. Eleven members present.

Mr. Albert L. Bancroft was elected a resident member.

Dr. J. Morrison and Rev. S. D. Simonds were proposed for resident membership; Dr. Wm. P. Gibbons, of Alameda, was proposed as a corresponding member.

Donations to the Library—W. A. Good-year's Translation of Bodemann and Kerl's Treatise on Assaying—presented by the translator.

Prof. W. P. Blake submitted the following mineralogical notices, which were read and referred to the Publishing Committee:

1. *Kerargyrite*.—Chloride of silver occurs in thin crusts, on gold-bearing quartz, in the Morgan gold mine, Carson Hill, Colaveras county. This vein is in the main gold belt, and is regarded as a part of the chief gold vein of the State. It is noted for the massive specimens of vein gold which it affords. The association of chloride of silver with the gold is novel, and has not been before observed by myself or others to my knowledge. A little galena occurs in the same vein, and in another part of it, gray copper ore, probably argentiferous, occurs sparingly, and may be the source of the chloride of silver. The crusts are about the thickness of an ordinary visiting card, and when freshly cut or scraped have a delicate pearl-gray color, which speedily changes to purple in the sunlight.

2. *Wulfenite*.—Molybdate of lead occurs in the argentiferous lead ores of the Empire mine, Inyo county, Cal. It is in crusts and seams about one-eighth of an inch thick, and is associated with galena, cerussite, malachite and chrysocolla. The contrast of the brilliant yellow color of this species with the masses of green silicate of copper, renders these specimens very beautiful and desirable for cabinets.

Sulphuret of Silver.—This mineral is found in ragged masses, matted with quartz crystals, and associated with free gold, in the "Silver Sprout" vein, Kearsarge District, Sierra Nevada.

Tungstate of Manganese.—I have received from Mr. Ewer fragments of a mineral from Weston, Nye county, Nevada, which appears to be tungstate of manganese. It is in radiating prismatic crystals; color, dark olive-green; high specific gravity, and before the blow-pipe gives reactions of tungstic acid and of manganese.

Specular Iron.—Mr. Bennett, of Durango, Mexico, has sent me some interesting crystallizations of specular iron ore, associated with oxyd of tin, from the tin washings of that place.

Pyromorphite, Cerussite, Galena, Tetrahedrite and Red Copper occur together in the Chicago vein, Shasta county, California.

Mr. Stearns read a paper on the death of Mr. Kennicott, accompanied with appropriate resolutions, which was referred to the Publishing Committee, from which are appended the following extracts:

It is my painful duty to inform the Academy of the decease of Robert Kennicott. The meager information received furnishes no particulars further than that he died suddenly, in the month of May last, at Milato Bay, in Russian America.

The services rendered to science by Mr. Kennicott are worthy of something more than a passing notice. In the month of May, 1849, we find him starting on a prolonged exploration of Russian America, under the auspices of the Smithsonian Institute, assisted by the University of Michigan, the Audubon Club of Chicago, and the Chicago Academy of Sciences. This exploration included also the territory occupied by the Hudson Bay Co., extending from May, 1859, to October, 1862. * * * Aside from the extensive collections in every department of natural history, the geographical information acquired by Mr. K. was also of the greatest importance. The Western Union Telegraph Co. having determined to post their wires so as to connect the old world with the new, by an overland line, passing through Russian America, thence to the central cities of Europe, the knowledge possessed by Mr. K. of a part of the territory through which the proposed line was to pass, made his services indispensable to the company. He was sought out, and his co-operation

at once secured. He entered upon this duty, hoping not only to do whatever lay in his power to make this enterprise a success, but hoping also to still further serve the great cause that was so dear to him; and while thus engaged in the zealous and enthusiastic performance of duty, in the prime of life, he has passed away. I move, Mr. President, the adoption of the following resolutions:

Resolved, That the California Academy of Natural Sciences have learned with the deepest regret of the untimely death of Robert Kennicott, and deplore the loss of one whose labors in the service of science entitle him to the grateful remembrance of his fellow-men.

Resolved, That we extend our heartfelt sympathy to the family and friends of the deceased.

Resolved, That a copy of these resolutions be forwarded to the family of the deceased, and to the Chicago Academy of Sciences, of which he was a prominent officer and an energetic member.

TEAS FOR NEW YORK VIA SAN FRANCISCO. The steamer Golden City, which sailed yesterday for Panama, took some twenty tons of Japanese teas for New York. This is but the beginning of a heavy business which must eventually grow up in this direction. When the Overland Railroad is completed, all lighter and more valuable productions of China, Japan, and the East Indies generally, for both Europe and America, must pass through San Francisco. The saving of time, interest, and insurance on this, over the Cape Horn or Cape of Good Hope waters, must become largely in favor of the proposed Continental route, and will, eventually, make San Francisco the greatest *entrepot* in the world.

GALE'S NON-EXPLOSIVE POWDER.—It is stated in the English papers, that Mr. James Gale, the inventor and patentee of the process of rendering gunpowder safe from explosion by mixing it with pulverized glass, has sold his invention to a company of capitalists for \$150,000 in cash, and an interest in the enterprise in addition. The company has not only undertaken the preparation of the non-explosive, but also include in their enterprise that of carriers of the article; taking contracts at the same rates as non-explosives of the same weight and bulk, thereby saving enormously, for shippers, in the cost of transportation. These facts, if they are such, look very much as though Gale's process was about to be accepted, in England, at least, as a practical reality.

PACIFIC HYGIENIC HOME WATER CURE, at Fountain Farm, near Oakland. Chartered and conducted according to the teachings of the Hydropathic College of New York, by the Pacific Hygienic Home Association (incorporated), B. J. SMITH, M. D., Consulting Physician; R. S. MACBETH, M. D., Attending Physician; W. G. W. HARBORN, Manager; H. ANDREWS, Business Agent. Office, Baths and Lecture Hall, No. 627 Sacramento street, between Montgomery and Kearny streets. "To all whom it may Concern."

ALL PARTIES negotiating for interests in the above Lode, would do well to examine titles before investing, as the legal title to a considerable portion thereof is vested in the undersigned.

WILLIAM MARSH,
W. L. KENNEY,
Keyville, Kern County, Oct. 1, 1863. 16v13ur3m

To Miners and Families Living in the Country.

DR. BOYNTON'S MEDICINE CHEST, is put up in San Francisco expressly for the use of families, and consists of a chest of moderate dimensions, neat in its appearance, containing those household articles, simple remedies, that families always feel like keeping on hand for immediate and common use, and a book of brief instructions, describing their use.

The object in preparing this Chest was not to make doctors, but for the simple purpose of nursing; hence, a majority of the remedies are such as are familiar to nearly all who are advanced in life, and the book is simply a representation of those plain truths relating to the department of the nurse already set forth in more extensive works. It was the object, not to say many things, but to say few things—to simplify and make plain for common use. And in selecting the contents of the Chest, the object was not to set forth something new and wonderful, but those of old and acknowledged worth.

In view of the above facts, physicians have everywhere encouraged the circulation of this chest in unmistakable terms. They recognize the fact that families do not, will not, need not call on them on the occasion of every slight derangement or infirmity. They do not and cannot deny the fact that such obligations of home cure rest upon heads of families.

The book gives a description of nearly every medicine in the collection, their use, and their component parts, so that every person may know what he is receiving into his stomach or applying to his person. This openness and frankness is regarded by the best practitioners, and all considerate persons as justice, more than policy. The universal conviction of the more thoughtful is, that that which relates to our health and physical well being in this life should, above all things, be known, and not kept in the darkness of secrecy.

In introducing this chest in the country, we always first submit it to the criticism of practicing physicians, and feeling the importance and seeing the necessity in this sparsely settled country of home-nursing, and seeing the adaptability of this chest, physicians in San Francisco, Sacramento, Stockton, Knight's Landing, Cuckeyville, Marysville, Colusa, Oroville, Lincoln, Folsom, and Auburn, have given it their hearty sanction. Seeing the necessity on the coast of people relying upon themselves in such matters, physicians in this State have remarked: "If I could choose but one for a family, I would every time choose the nurse instead of the physician." "If families would get a collection of simple remedies, with plain instructions for their use, they would do away with half the doctoring." "All families should possess themselves of a collection of common remedies, with plain instructions for their use." "I would like to see the chest in every family." "It is a convenience." "It is useful." "Much sickness and much expense might be saved by such home cure."

We subjoin the following statistics from Sutter County, California:

"The undersigned have had Dr. Boynton's Medicine Chest in their families for the last few months, and willingly state that they regard it as a wise provision, strictly practical and highly useful."

Every person having the chest in the above named county has signed the above article. The publishing of the names being unnecessary, we withhold them and save space.

The undersigned have known Dr. Boynton's Medicine Chest for the last few months, and regard it as a wise provision, and highly useful in every family. The medicines being put up with instructions, its utility, convenience, and great economy are unquestionable.

Signed by Judge HURLBURT and 45 others.

STATE OF CALIFORNIA, } ss.
County of Sutter,
I, C. E. WILCOX, County Clerk in and for said County, hereby certify that I am personally acquainted with a majority of the individuals whose names are subscribed to the foregoing certificates, and that they are good and substantial citizens of said county.
Witness my hand and official seal this 27th day of [L. S.] December, A. D. 1865.
C. E. WILCOX, County Clerk.

Agents wanted in every County to sell this Family Chest. Their compensation will be a liberal commission on all sales. The Agent should be a resident of the district which he is to canvass, and accompany his application with good references, and of this city if possible.

We can give further particulars when desired.
All letters should be addressed through the post office, to

FOR SALE!

QUARTZ AND MINING MACHINERY.

ONE GARDNER'S THUNDERBOLT CRUSHER, LARGEST size and best quality; is entirely new, with all extras, with a large lot of other Quartz Machinery, including Engines, Boilers, etc.
16v13 COFFEY & RISDON.

THE MINING AND SCIENTIFIC PRESS, published by Dewey & Co., San Francisco, should be in the hands of every miner. It gives every week information that is indispensable to the proper prosecution of mining. Every miner can avail himself of the latest improvements by subscribing for it.—(Havilah Courier, Oct. 13.)

THE BUENA VISTA PETROLEUM COMPANY.—A letter to the Stockton Independent gives the following account of the operations of this organization:

The company was organized and incorporated in February, 1864, with a capital stock of \$8,500, divided into 850 shares. In 1865 the stock was increased to 1,700 shares, of \$1,000 each. The company, by assessment, procured the present machinery, and erected works on their claim capable of producing 5,000 gallons per month of marketable oil.

The first run was made about the 10th of August, and produced 800 gallons of burning and lubricating oil, which has been tested in various parts of the interior and proved to be a good article. The company are at present producing and shipping oil which compares favorably with any Eastern oil.

The quantity of crude oil is immense; yields 40 per cent. burning oil and 50 per cent. lubricating at a depth of only twenty-three feet from the surface. The facilities for shipping are such that the refined oil from the Buena Vista works can be laid down in San Francisco at the same cost as crude oil from San Buenaventura, and less than from Los Angeles. The yield of the springs is unprecedented in the State, and the quality is second to none. The stock has never been placed in market for the benefit of "bulls and bears," but is mostly held by original locators, and all the money which has been expended has been raised among the stockholders.

The company believe that by increasing their distilling works, the next year they will be able to place in market a sufficient quantity of oil to stop, to a great extent, the shipments from the East, and to make it one of our staple products.

The works are under the superintendence of W. O. Sleeper, of Columbia, and Hughes & Keys, of Stockton, are the authorized agents of the company.

THE CHEMICAL CONTENTS OF A CUP OF TEA.
The cup of tea we drink, according to chemical analysis, contains volatile oil, chlorophyll, wax, resin, gumi, tannin, theine, extractive, apotheme, albumea, sulphur, phosphorus, chloride of potassium, oxyd of iron, carbonate of magnesia, manganese, and silica—twenty different articles. The peculiar flavor of tea depends on the volatile oil, which is lighter than water, and has a lemon-yellow color and the smell of tea. Liebig is of the opinion that tea is not only an astringent and diluent, but possesses nutritive properties of no mean kind. A great deal of profound chemistry is connected with the subject of theine as it exists in tea, and caffeine in coffee; both of the same property, or substance, contained in dissimilar vegetable productions—the leaves of one tree and the berries of the other. Tea and coffee act upon the nerves and upon the brain, and have a quickening and refreshing influence; but taken in excess result in excitement prejudicial to sleep and rest. Green tea is considered more injurious to persons of a highly nervous temperament than the black. *Chemical News.*

Machinists and Foundries.

PALMER, KNOX & CO.,

BACON & STEWART,
PRACTICAL MACHINISTS,
No. 51 Beale Street, San Francisco.

All kinds of Machinery made and Repaired.
Particular attention paid to PRINTING PRESS work.
All jobs entrusted to us will be attended to with promptness and on reasonable terms. The patronage of Printers is respectfully solicited. 13v10q-1f

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic Hay Rags, Screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.
ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fly Engine.
BOILERS.—Locomotive, Flat, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.
PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.
Russia Iron Screens, of all degrees of fineness and of all qualities of Iron. All work done in the best manner at the lowest cash prices.

THE DECADENCE OF BRITISH TIN MINING.—There is one branch of industry, connecting modern civilization with that of the ancients more remarkably than any other, which has existed in the same spot from 500 years before the birth of Christ to the present day, but now appears likely to be laid aside—eaten out by its own industry—viz: tin mining in Cornwall. During all this period, Cornish miners have continued working incessantly, with few or none of those violent interruptions of foreign races which have changed the social character of most other parts of Great Britain. Some, perhaps, were offered in sacrifice, enclosed in the wicker work idols of the ancient Britons; some were taken to serve in the Roman legions; and some died under the banners of Prince Arthur and the Knights of his Round Table. They have listened to the teachings of the Druids, of the Christian missionaries from Rome, of the Lutheran reformers, but their hands have kept incessantly at work with pick, and gad, and drill, conserving and using the ideas of their ancestors as if endowed with a mining instinct. But "all things have an end." This occupation is at length to be reckoned among the things that were. It is being swamped by an overflow of tin from the recently worked deposits at Banca, the extent whereof no one seems to know, but the produce of which continues to flow in, leaving a profit to the Dutch traders of \$168 per ton when selling at \$553, a price which nets the Cornish miner a loss of \$70 per ton! They cry aloud for protection; but free trade has so long prevailed in England, that we think they cry in vain. The Cornish tin miners' occupation seems then to be gone. To go out to the Banca tin mines and compete with the Chinese and other rice-eaters who work for 12½ cents and less per day, is out of the question. Hence there seems to be no help for them but discontinuing an industry which has ceased to be profitable and betaking themselves to copper or other mining operations.—*Am. Journal of Mining.*

ORIGIN OF THE SIGNS + AND —. A recent writer in the *London Athenaeum*, gives the following as the origin of the signs + and —. He says: The first of these signs is a contraction of *et*. The course of transformation from its original to its present form may be clearly traced in old MSS. *Et* by degrees became &, and & became +. The origin of the second (—) is rather more singular. Most persons are aware that it was formerly the universal custom, both in writing and printing, to omit some or all of the vowels, or a syllable or two of a word, and to denote such omissions by a short dash, thus —, over the word so abbreviated. The word *minus* thus became contracted to *mins*, with a dash over the letters. Alter a time the short line itself, without the letters, was considered sufficient to imply subtraction, and by common consent became so used. Hence we have now the signs + and —. [*Annual of Scientific Discovery.*]

Rheumatism'!!

ANOTHER WITNESS!

SALMON FALLS, June 17, 1865.

H. BOWMAN—DEAR SIR: HAVING HAD A FAIR test of the virtues of RICHARDS' REMEDY for Rheumatism, I take great pleasure in stating that its effects will have been even better than its recommendations claim. In 1863 I first heard of the Medicine. I had then been for three years severely afflicted with Rheumatism, and having tried everything I could hear of, without any permanent benefit, I concluded to try this also.
On taking the medicine, in three days I experienced great relief, and in one week was entirely free from pain, and had completely recovered the use of my limbs, which had become almost powerless, so much so that I could not dress myself without assistance. Since that time I have been free from Rheumatism. I have recommended RICHARDS' REMEDY to numerous friends, and in every case it has proved successful. I therefore take great pleasure in recommending it to all who are afflicted with Rheumatism, and especially to all mercurial chronic Rheumatism cases.
Yours respectfully,
(Signed) ERASTUS PARSONS,
President of the Gen. Grant Mining Company.

RICHARDS' REMEDY is for sale by
H. BOWMAN,
Druggist, Sacramento.
Price, \$2.50 per Bottle. 11v13

Important to Californians.—Many inventors have lately had their claims for Patents seriously and in some cases fatally delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press Patent Agency has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

SPIRITS OF TURPENTINE & ALCOHOL

NOTE.—We would specially call the attention of Mill owners and Engineers to our superior PARAFFINE OIL, which we manufacture from the California Petroleum. This Oil will not gum. Machinery thoroughly cleaned and lubricated with it will not heat, and after remaining at rest, can be started without cleaning off.
A sample can of our Paraffine Oil will be forwarded on application to us, as we desire a fair and impartial trial.

Lamps and Lamp Stock!

An elegant and complete assortment on hand. 2v 4v13-3m19 414 Front street, San Francisco.

THE CALIFORNIA
Aerated or Unfermented
BREAD COMPANY.
Bakery on Folsom Street,
Between Tenth and Eleventh.....SAN FRANCISCO

MESSRS TAGOART, BULKLEY & DUFF, HAVING ASSOCIATED themselves in partnership, are happy in announcing to the public that they are now prepared, and would respectfully solicit, all orders for their truly wholesome and cleanly Bread. We have a sufficient number of delivery wagons at our bakery to guarantee to all who may favor us with their patronage a prompt delivery of fresh bread daily, Sundays excepted.
Through the kindness of the gentlemen of the following named firms, we are privileged to keep an order box for the entry of all orders for the bakery so that they may reach our earliest attention:
Order box at C. J. Hawley & Co.'s Grocery, corner Second and Jessie streets; Rowland & Walker 547 Clay street; Plum's Carpet Store, Montgomery street, opposite Lick House; G. W. Clark, Paper Hanging, corner Sansome and Clay streets. Orders handed to any of the route-men likewise. We expect soon to be prepared to supply Pastry, likewise the Boston Brown Bread, and Buns of the first quality. Due notice will be given.
The present Company is entirely independent of the former California Unfermented Bread Company, neither of them having been in any way connected with that company.
We would cordially invite the public to make a visit to our new bakery.
4v13-3m S. R. BULKLEY, Business Partner.

EUROPEAN

METALLURGICAL WORKS,

—AND—
Practical Mining School,
Bryant Street, Between Third and Fourth,
SAN FRANCISCO.

THE PROPRIETORS are at all times prepared to work or test 1. Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyrites, and the so-called "rebellious ores" are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit all parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

 and Pine. 14v13-3m

Delays are Dangerous.—Inventors on the Pacific
 Coast should bear in mind that by patronizing our Patent
 Agency they can sign all necessary papers for securing pa-
 tents almost immediately, thereby avoiding the three
 months' delay requisite in transacting business through
 Eastern agencies.

Brodie's Patented Improvements

FOR THE TREATMENT OF
Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER.
 The attention of all interested in Mining is respect-
 fully called to this Improved Machine for Breaking or
 Spalling Quartz, or other Rock, possessing, in it does, sim-
 plicity of action and lightness of construction, so far as is
 compatible with strength and durability. In consequence
 of these advantages, the advertisers are enabled to offer
 these machines to the public at the following low terms:

No. 1—Or 10 inch Crusher, capable of reducing from
 three to four tons of quartz per hour, 10 pieces be-
 ing larger than a walnut—price.....\$600
 No. 2—Or 15 inch Crusher, capable of similarly putting
 through five to six tons per hour.....850
 No. 3—Or 18 inch Crusher, with a similar manner
 crush from seven to eight tons per hour.....1,200

The above Crushers have been recently erected and are
 now successfully employed at Bear Valley, Mariposa coun-
 ty, Rawhide Ranch, Tuolumne county, Excelsior Mine,
 Lake District, Nevada county, and can be seen in operation
 at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of
 this Crusher, has been received from the Superintendent
 of the "Rawhide Ranch" Mine, in Tuolumne County:

JAMES BRODIE, Esq., San Francisco. My Dear Sir: It gives
 me pleasure to inform you that I have for the past three
 months had one of your largest sized Rock Crushers in
 use, at the Rawhide Ranch Mining Company's Mill, which
 has entirely met my expectations, and I have no hesita-
 tion in recommending to all who are in need of a machine
 for rapidly, cheaply and properly preparing quartz for the
 stamps. Yours truly,
 Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGA-
MATING BARREL.—This Barrel obtained a premium at
 the Fair of the Mechanics' Institute in San Francisco, in
 1884. Further particulars will be afforded on application
 to the subscribers.

These infringing the patent rights to the above Improved
 Barrel, are hereby informed that on and after the 1st No-
 vember, 1886, the royalty charged for using the same will
 be raised to the sum of \$100 per Barrel.

A diagram, with explanations of this machine, will be
 found in the "Mining and Scientific Press," of September
 29th, 1886.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR
DRY CRUSHING.—This Dry Crusher has been found the
 most economical and effective mode of crushing ores in
 Mexico, California and Nevada. Diagrams and explana-
 tions afforded on application to the subscribers.

A drawing and full description of this machine will be
 found in the Mining and Scientific Press of Sept. 22d, 1886.

New Mining Advertisements.

Great Central Mining Company.—Location of
 Works: Yuma County, Arizona Territory.

Notice is hereby given that at a meeting of the Board of
 Trustees of said Company, held on the fifteenth day of Oc-
 tober, 1886, an assessment of one dollar (\$1) per share was
 levied upon the capital stock of said Company, payable im-
 mediately in United States gold and silver coin, to the Sec-
 retary, at the office of the company, No. 302 Montgomery
 street, San Francisco, Cal., from 4 to 5 P. M.

Any stock upon which said assessment shall remain un-
 paid on the fifteenth day of November, 1886, shall be de-
 deemed delinquent, and will be duly advertised for sale at public
 auction, and unless payment shall be made before, will be
 sold on Monday, the third day of December, 1886, to pay
 the delinquent assessment, together with costs of advertis-
 ing and expenses of sale. By order of the Board of Trustees,
 O. D. SQUIRE, Secretary.

Office, No. 302 Montgomery street. oc20

American and Foreign Patents.—Letters Patent
 for Inventors are secured in the United States and foreign
 countries through the Mining and Scientific Press Patent
 Agency. We offer applicants reasonable terms, and they
 can rest assured of a strict compliance with their obligations,
 and a same prompt and efficient service. For reference,
 we will furnish the names of numerous parties for whom
 we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new in-
 ventions of machinery and important improvements, can
 have the same promptly and efficiently secured in the Mining
 and Scientific Press, free of charge, if in our judgment the
 discovery is one of real merit, and of sufficient interest to
 our readers to warrant publication.

George Washington Gold and Silver Mining

Company, Silver Mountain District, Alpine County, Cal.

Notice.—There are delinquent, upon the following de-
 scribed stock, on account of assessment levied on the
 seventeenth day of September, 1886, the several amounts set
